EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ⟶ Display, $10.00 per column inch. 2 inches maximum, larger units at regular display unit rates. No discounts or allowances.
SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 5th and 20th, closing dates for editions of CHEMICAL and ENGINEERING NEWS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete. EMPLOYERS are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

UNEMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 announcements free (one per issue) set in standard style and limited to 50 words each, including 8-word box address, and 3 additional standard announcements at 50% of regular rate. Further announcements and excess words at full rate.

EMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

EMPLOYERS seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contracts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemist's Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 505 N. Michigan Avenue, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

EXECUTIVES, CHEMICAL ENGINEERS AND CHEMISTS with exceptional backgrounds of experience should use our confidential and individual method of contacting responsible employers. No limit to territory. We negotiate all overtures. Established 1915. The National Business Bourse, 20 W. Jackson Blvd., Chicago, Ill.

CHEMIST with some petroleum experience. Needed in Chicago area for development of petroleum products and rust preventives. State age, draft status, degree, and salary desired in opening letter.
Box 79-TP-8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST ABLE to conduct research work with minimum supervision wanted primarily for development of synthetic drying oils. Man with draft deferment because of physical impairment preferred. Send inexpensive photograph and give complete personal, professional and academic data in first letter. All letters acknowledged. Address P.O. Box 377, Dayton, Ohio.

BIOCHEMIST, hospital, expert in use of clinico-chemical methods, with some administrative ability. Permanent position. Opportunity for research. Salary $2200 with maintenance. Graduate degree or equivalent experience required. Submit reprints, references, photograph, list of relevant courses and grades to John G. Reinhold, Biochemical Laboratory, Philadelphia General Hospital.

ORGANIC CHEMIST Ph.D.—wanted for Newark, N. J., industry. Recent graduate or with a few years' experience preferred. For individual research involving synthetic resins. Sound training in synthetic organic, physical organic, and physical chemistry essential. Give experience, education, and salary expected.
Box 23-TP-10, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER—Recent Ph.D. from accredited university to handle development research in synthetic resins. Permanent responsible position in Newark, N. J., industry. Give experience, education, and salary expected.
Box 24-TP-10, Ind. & Eng. Chem., Easton, Pa.

WOMEN CHEMISTS: Applications invited from women chemists for positions in a growing industry where few technically trained women have been employed. Openings in analytical, research and development, with probability of continuation after war. Location East.
Box 44-TP-10, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST—Graduate within past 5–10 years. Background organic chemistry, synthetic resins. Wanted for technical sales correspondence, preparing technical bulletins, library work, reports, etc. Excellent and unusual opportunity for right person. Location small New York State town. Give complete information, salary expected, recent photograph.
Box 49-TP-10, Ind. & Eng. Chem., Easton, Pa.

RESEARCH and PLANT Chemist with Ph.D. degree desired by progressive Tobacco Company. Training and experience in Plant Biochemistry necessary. Must be qualified to plan and conduct research. Give training, experience, draft status, personal data, salary expected and recent photo in first letter.
Box 68-T-10, Ind. & Eng. Chem., Easton, Pa.

CHEMIST for research and development who has had varied practical experience in coatings such as lacquers, synthetics and enamels. One having had experience with paper products preferred but not essential. Splendid opportunity and permanent position with a company now engaged in war work. State technical education, experience, age, and draft status. Correspondence strictly confidential.
Box 71-TP-10, Ind. & Eng. Chem., Easton, Pa.

GRADUATE FELLOWSHIP at $720–840 per year and Technical assistant at $1200 per year at Medical School for investigations in endocrinology, enzymes and metabolism.
Box 10-N-11, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST—A large paper manufacturer located near Philadelphia has a splendid opportunity for a graduate chemist or chemical engineer in its research department. Education, past experience, training and the ability to see a project through are major qualifications. As this is a permanent position we are interested in age, marital and selective service status. Reply by letter only giving full details with salary requirements and recent snapshot. Replies will be kept in strictest confidence.
Box 13-NP-11, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST: Research, organic. Work on preservatives, disinfectants, etc. Some Bacteriological experience desirable. Small laboratory, pleasant surroundings. Connecticut, one hour from New York. Send full record, salary required.
Box 17-NP-11, Ind. & Eng. Chem., Easton, Pa.

CHEMIST WITH some petroleum experience. Needed in Chicago area for development of petroleum products and rust preventives. State age, draft status, degree, and salary desired in opening letter.
Box 18-NP-11, Ind. & Eng. Chem., Easton, Pa.

GLASSBLOWER WANTED, familiar with Pyrex, capable of making all types of glass equipment for research and development organisation. Permanent position, large company, southern Louisiana. Give personal data, experience, salary expected, references, draft status, recent informal photograph.
Box 19-NP-11, Ind. & Eng. Chem., Easton, Pa.

LABORATORY ASSISTANT for organic research laboratory in New York City. B.S. in chemistry or equivalent required. State in detail experience, references, age, date when available and send inexpensive photograph.
Box 21-NP-11, Ind. & Eng. Chem., Easton, Pa.

WANTED: for organic research laboratory in New York City. Experienced organic research chemist, Ph.D., with several years' experience in organic synthesis, preferably dyestuffs or pharmaceuticals. State age, academic, professional and draft data, when available, salary expected.
Box 22-NP-11, Ind. & Eng. Chem., Easton, Pa.

CHEMIST for analytical work. Man or Woman. Excellent opportunity with large chemical pigment manufacturing company near New York City. Right person can soon become head of analytical laboratory.
Box 32-N-11, Ind. & Eng. Chem., Easton, Pa.

INORGANIC or PHYSICAL chemist—B.S. with several years' research experience or M.S. or recent Ph.D.—for long range pigment project in New York vicinity. Exceptional opportunity. Research ability and initiative essential. State training, experience, draft status and salary desired. Include photograph.
Box 36-NP-11, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, ENERGETIC, versatile, for independent research work in interesting and important new field. Experimental ingenuity and good fundamental background in physical and organic chemistry required. Must be interested in doing laboratory experimental work. Will be provided with assistant and located at an eastern research institution where best of facilities and contacts exist. Please give complete details in first letter, including training, experience, photograph if available, salary expected, etc.
Box 35-NP-11, Ind. & Eng. Chem., Easton, Pa.

INORGANIC or PHYSICAL chemist—B.S. with one or two years of research experience or recent M.S.—for essential war research in New York vicinity. Give age, draft status, academic background, industrial experience, salary expected and photograph.
Box 37-NP-11, Ind. & Eng. Chem., Easton, Pa.

WOMAN MICRO-ANALYST with some experience in microanalysis for vacancy in industrial research laboratory in New York area. Please give academic training, experience and salary expected. Include small photograph.
Box 38-NP-11, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST—M.S. with some experience or recent Ph.D.—for synthetic organic chemical research in industrial laboratory on mid-eastern seaboard. Capable chemist with good academic foundation and well developed laboratory technique. Give age, draft status, training and experience, salary expected and photograph.
Box 39-NP-11, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER—Raw material development work in large manufacturing concern. Advanced degree and knowledge of organic insulating materials desirable but not essential. In reply submit snapshot and give age, details of qualifications, experience and salary expected.
Box 40-N-11, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL ANALYTICAL chemist for research laboratory. Essential industry specializing in metal products. Man or woman to develop new analytical methods and do physical-chemical research. Location in New Jersey near New York City.
Box 41-NP-11, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST WANTED—Instructorship or Assistant Professorship in Southern Medical School for the duration. Give details concerning training, experience, personal history, references, and date of availability.
Box 42-N-11, Ind. & Eng. Chem., Easton, Pa.

GRADUATE ASSISTANTS—For semester beginning February first—Fifty dollars per month with free tuition and fees—Stipend increases annually—Minimal requirements: inorganic, analytical, organic, physical chemistry, calculus and one year of college physics—B.S. or M.S. degree—Submit small photograph and official transcripts of college courses—If satisfactory, application blank will be sent—Department of Chemistry, University of Pittsburgh, Pittsburgh, Pa.

AN ENGINEERING Construction Company, with long experience in Spanish America, is starting an Export Department and needs an experienced Chemical Engineer familiar with the design and operation of heavy chemical plants, particularly caustic soda and cyanide. Headquarters in New York City and to also spend considerable time in South America. Most advisable that he speak Spanish.
Box 55-NP-11, Ind. & Eng. Chem., Easton, Pa.

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised, or in regard to those seeking employment.

WANTED

A Man with an Outstanding Reputation of Accomplishments in Plant Management

We require a man to take complete charge of one of our important plants located in Chicago. He will be responsible for selecting and buying raw materials, production and production analysis in all its phases and he will also be responsible for a laboratory engaged in development and experimental research.

The position is a permanent one in an essential industry. The initial compensation offered is commensurate with the responsibilities of the position and future compensation will depend upon ability to contribute to profits.

To qualify, an established and outstanding record in a similar capacity is essential. He should be thoroughly grounded in physical and colloidal chemistry.

The man we have in mind will also be a "perfectionist", who to achieve perfection in finished product, has a flair for pioneering in developing better raw material, improved manufacturing processes and rigid inspection procedures. To this end, he will receive encouragement and assistance from his employer.

He will be a man of sound judgment and a realist concerning production costs. By leadership, he will have the proven ability to get the fullest cooperation from his associates and the respect of his plant personnel.

If you feel that you are qualified to meet these requirements please write us in detail giving personal and business background. To help us judge what you may be able to do for us, tell us in specific terms what you have accomplished for others. We shall not require the name of your present employer until we have established a mutual interest.

Please address your letter to:

Executive Vice President
Box 20-NP-11, Ind. &. Eng. Chem.
Easton, Pa.

DIRECTOR OF RESEARCH

One of the outstanding Engineering Companies in the East, now engaged almost wholly in war work, is enlarging research and development organization, and has opening for Chemist or Chemical Engineer as Director of Research. Field chiefly petroleum and manufacture of chemical derivatives therefrom, and will include direction of laboratory and semi-commercial pilot plant work. This is a responsible position calling for initiative and foresight as well as the proper technical qualifications. Starting salary will be very attractive and future limited only by individual's capabilities.

Box 54-NP-11, Ind. & Eng. Chem., Easton, Pa.

CHIEF ANALYTICAL chemist to head the control laboratory for large producer of pharmaceuticals; must have broad experience in analysis and quality control; do not desire research chemist; must have executive experience and ability.
Box 45-N-11, Ind. & Eng. Chem., Easton, Pa.

COMPETENT PHARMACEUTICAL chemical executive to supervise analytical and control work. Must have adequate analytical training and experience as well as proven executive experience and capacity, preferably in the pharmaceutical field. Submit full personal history, training and experience record and salary requirement in first letter—please.
Box 56-N-11, Ind. & Eng. Chem., Easton, Pa.

OIL CHEMIST experienced in lubrication problems of all types for laboratory and sales development work in the field of oil additives. Please give past experience in detail. Confidential.
Box 61-NP-11, Ind. & Eng. Chem., Easton, Pa.

CONTINUOUS OPENINGS for college graduates in 5-day week positions within commuting distance New York City. MAN OR WOMAN—PHARMACOLOGIST, old established pharmaceutical manufacturer, $3000–$5000; ORGANIC chemist, $3000–$5000: WOMEN—ANALYTICAL chemistry major, no experience required, research and development department, oils, fats, soaps, to $150: CONTROL, manufacturer biologicals, to $40: ASSISTANT Control chemist, Physical & Quantitative Inorganic Analysis to $40: ANIMAL technician, college laboratory, $1500: PHARMACEUTICAL chemists, major drug house, to $45: MEDICAL DIRECTOR, old established pharmaceutical manufacturer, must be accomplished promotion writer familiar with ethical copy requirements, and conduct of clinical research. To $8000. MEN—VITAMIN assayist and analyst by chemical and physical methods. Organic and inorganic training. Microbiological experience, to $3500. M.S. or Ph.D. for Pharmaceutical and control laboratory, with experience in physical and colloid chemistry. Must have organic pharmaceutical training, to work on vitamin specialties $3600–$6000: ORGANIC CHEMIST to be No. one man in Vitamin laboratory. Special emphasis on vitamin and sterol fields, for highly technical operations on fundamental research, $3600–$6000: ORGANIC synthesis, to $225: SANITARY engineer, make atmospheric contamination factory inspections nationally, $2400–$3000 plus all expenses: PILOT plant experience for pharmaceutical production, to $4160: PHARMACEUTICAL plant experienced chemical engineers preferred, to $3300: SALESMEN, dry cleaning trade, sell filter powder, make plant demonstrations, Illinois, Indiana, Detroit, headquarters Chicago, $200–$250 and expenses: SALES TRAINEES, chemistry or allied science graduates, nationally known manufacturers, chemicals and pharmaceuticals, some cars furnished, expenses and $175–$250: TABLET coaters and ampule sterilising experience, to $55. APPLICATIONS ACCEPTED IN THE STRICTEST CONFIDENCE. Everett Brown Agency, 17 John Street, (branch) 331 Madison Avenue, New York City.

WANTED: Junior Analyst, Woman. College Graduate preferably trained in chemistry and pharmacy. Location metropolitan area.
Box 71-NP-11, Ind. & Eng. Chem., Easton, Pa.

BACTERIOLOGIST, M.S.—permanent position with well known, long established, eastern pharmaceutical manufacturer. Woman with one or two years' practical experience, and knowledge of mycology preferred. Reply should include information on educational training, industrial experience, personal data, salary expected and picture.
Box 74-NP-11, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(A.C.S. MEMBERS)

WOMAN CHEMIST: M.S. in chemistry 1939, University of Pennsylvania. Organic major, analytical minor. Desires preferably research position with company having war contracts. 3 years' college teaching experience. Available immediately for position in Philadelphia and vicinity. Protestant. Married.
Box 26-N-10, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL CHEMIST, B.S., Phar.D., Columbia University. Three years of graduate research, one year of product development work. Age 28, draft deferred, member Sigma Xi. Desires position to do research, product development, testing or other.
Box 29-N-10, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, available for spare time work. Broad training and experience, including catalysis, petroleum and fuels technology, explosion processing, pharmaceutical synthesis, metallurgical chemistry. Specialist in new process development and plant design. Currently employed, with contract permitting outside work of practically unlimited scope. Central eastern U. S. war work only.
Box 63-N-10, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC ORGANIC chemist. M.S. research and development experience in plastics. Desires organic research position (plastics or other industry) contributing directly to war effort. Young, married, responsible. Presently employed. Metropolitan location preferred.
Box 36-N-10, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D., now in class 2-A, in charge of small laboratory for pharmaceutical manufacturer, seeks position in closer connection with defense work. Experience in drug analysis and research.
Box 66-N-10, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST—Ph.D. February 1943 from an eastern university. Well grounded in organic synthesis. Single, 24, 2-A in draft. Physical chemistry minor. Eastern location preferred.
Box 15-T-10, Ind. & Eng. Chem., Easton, Pa.

RESEARCH DIRECTOR, Ph.D., assistant at two world renowned universities. 12 years' research experience in organic synthesis and biochemistry (hypnotics, analeptics, vasoconstrictors, antiseptics, vitamins, hormones). 5 years' research director of French industrial laboratory, one year research director of American industrial laboratory. Desires similar position in large industrial research laboratory or university. Age 36, first citizenship papers, draft status 2-B.
Box 31-T-10, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST. M.S. from leading eastern university. Excellent organic background. 6 years' experience in research and analysis. Research or development desired but will consider any exceptional opportunity. East or Midwest. Age 30, single, 3-A, Christian, employed, available short notice.
Box 38-T-10, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST: 16 years' broad experience in research, development, production and consultation; technical director of research for western division of large chemical industry; special research on magnesium products, slats and refractories; patents; publication; good background in mathematics, physics, engineering, bacteriology and crystallography; M.S. degree University of California; desires position on West Coast; age 39; married; one child; available immediately.
Box 42-T-10, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, M.A. 1939. Two years with major petroleum corporation and one with well-known research institute. Most of course work for doctorate at large mid-western university. Thermodynamics, colloid chemistry, electrochemistry, advanced organic, physics, mathematics. Research. Sigma Pi Sigma. Read German, French, Russian. Age 28, married, draft deferred.
Box 45-T-10, Ind. & Eng. Chem., Easton, Pa.

BIO-ORGANIC CHEMIST Ph.D. May, 1942. Research experience in organic, enzyme, vitamin (pyridoxine and pantothenic acid chemistry). Formerly employed on vast industrial vitamin project. Papers being published. Member Phi Beta Kappa, Phi Lambda Upsilon, Sigma Xi. Interested in research vital to war effort in above fields. East only.
Box 53-T-10, Ind. & Eng. Chem., Easton, Pa.

FOOD CHEMIST, Ph.D., many years of research and aggressive development experience. Has a thorough knowledge of the technical and consumer problems of the shortening and margarine industries. Capable of directing laboratory findings to successful plant operation. Draft deferred.
Box 12-N-11, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S., 3 years' analytical experience, some graduate work. Desires position in organic control or synthesis. Age 28, draft 4-F. Prefer New York or New Jersey.
Box 23-N-11, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST. M.S. Six years' industrial experience embracing research and development in petroleum, pigments, organic preparations including soaps; also college teaching. Desires college teaching with opportunity for research in spare time, but will consider industrial position. Southwestern location preferred. Draft deferment guaranteed. Available after 30 days notice. Age 28.
Box 30-N-11, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, Ch.E. Broad training, experience in food chemistry and technology, metallurgical chemistry. Desire more essential position, preferably research or development. Now employed midwest, but location immaterial. Age, 27. Married. Draft, 3-B.
Box 31-N-11, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST, Ph.D., 15 years' experience with law degree recently added. Desires position requiring technical-legal understanding.
Box 33-N-11, Ind. & Eng. Chem., Easton, Pa.

ORGANIC RESEARCH Chemist; development engineer, B.Ch.E., M.Sc., eleven years' unusual experience on research and development of hydrocarbons, resins, dyestuffs and intermediates. Excellent scholastic record. Sigma Xi, patents. Practical, versatile. Age 33, married, one child, 3-A. Employed. Desires permanent and responsible position in above-mentioned fields. Available on reasonable notice.
Box 34-N-11, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 1495)

(Situations Wanted Continued)

CELLULOSE-LIGNIN—Pulp and Paper-Plastic Ph.D. Research Chemist. Now employed. Permanently deferred. Experienced both as a research chemist, in plant practice, and as Director of Research. Desires position as Technical adviser to President, or as Junior Technical Sales and/or Field Executive. Only employers needing such a man should reply.
Box 44-N-11, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER and chemist 20 years' experience in research, process development and production of chemicals, design of chemical equipment, seeks responsible position where services will contribute more to the winning of the war. Qualified to undertake technical investigations; sound business judgment and administrative ability; expert knowledge of oils, fats and their derivatives, glycerine and other chemicals. Good character, sound health, married, Protestant, American citizen with draft status 3-B.
Box 46-N-11, Ind. & Eng. Chem., Easton, Pa.

RESEARCH and DEVELOPMENT chemist, Doctorate training, seven years' petroleum and natural gas hydrocarbon experience. Fuel technology, catalytic syntheses, process development. Capable of responsible position in petroleum or allied industry
Box 49-N-11, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL PATENT attorney seeks responsible position with chemical corporation. Age 36. At present employed in patent department of Midwestern organic chemical corporation. Available December 1st. Excellent qualifications. Could organize patent department.
Box 52-N-11, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D., with training in electrochemistry and metallography, desires position in research or production with opportunity to assist directly in the war effort. Five years' experience in semi-pilot plant work. Now employed. Age 32, married, draft classification 3-A. Prefers east or northeast.
Box 53-N-11, Ind. & Eng. Chem., Easton, Pa.

CAN YOU use me? 8 years' experience research, development and high spot trouble shooting in non-ferrous and pigment fields. I have cut analytical methods from hours to minutes, devised instruments to replace scarce personnel, stepped up production, and gotten to the root of all evils. My personal [illegible] must be a quicker way." Have numerous publications, patents, and two books. Thousands of ideas. Protestant, married, deferred, excellent references. Desire a position of responsibility where initiative and imagination are prime attributes. Not employed in defense.
Box 57-N-11, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B.S. (Ch.E.) 3½ years' experience in photographic chemicals, photography, and salesmanship. 22 years old, single, draft status 2-A. Not particular what field of Chemical Engineering work is in. Available after Dec. 1, 1942.
Box 59-N-11, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST—13 years' experience as supervisor in analytical laboratory of large rayon plant. Employed at present. Married, one child, age 39, draft 3-A. Desire permanent position with greater chance for advancement than present position.
Box 60-N-11, Ind. & Eng. Chem., Easton, Pa.

TEACHER—INORGANIC and Physical, Administrator. Ph.D. In present position sixteen years. Primarily a teacher but want opportunity for research. Here is a 48 year old who can vitalize chemistry to his students.
Box 62-N-11, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D., Yale. Wants research or teaching in middle west or east. Fourteen years' experience teaching and industrial work. Thermodynamics, Electrochemistry, Alumina Extraction. Twenty publications. Employed, but climate unsuitable to family. Gentile, active, successful, executive ability, class 3-B draft.
Box 72-N-11, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED (NONMEMBERS)

RESEARCH LIBRARIAN. College woman; experienced in literature and patent searches in organic chemistry and synthetics; languages. Library administrator; can assume responsibility. Not interested in abstracting or typing. Location immaterial.
Box 82-T-10, Ind. & Eng. Chem., Easton, Pa.

MECHANICAL ENGINEER. Five years' development work, large chemical company. Experience includes many types chemical plant equipment. Honor graduate leading Eastern university, A.B., B.S. and M.E., age 28, member A.S.M.E., married, class 3-A, native U.S. citizen. Location East of Rockies.
Box 26-N-11, Ind. & Eng. Chem., Easton, Pa.

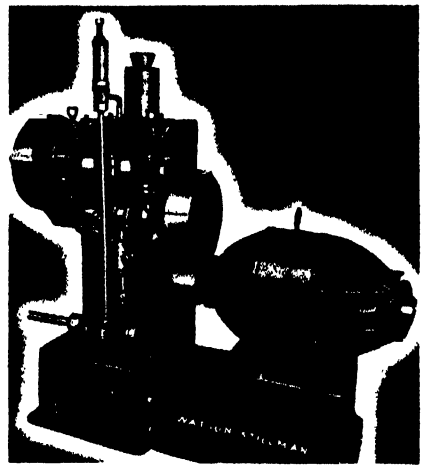
ORGANIC CHEMIST, Ph.D., desires consulting work in the New York City area.
Box 28-N-11, Ind. & Eng. Chem., Easton, Pa.

SAFETY Engineering position desired by woman chemist, M.A., 1934, organic major, safety engineering and first aid training. Prefer company manufacturing organic chemicals.
Box 48-N-11, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B.S., 1937, inexperienced, desires opportunity in control, production, or development, New England, East.
Box 51-N-11, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST. B.A. 1942. Honors in chemistry. 44 hours. Desires position organic field. Knowledge French, German, Shorthand, Typewriting. Prefer west or middle west near university. Age 20. Single, Protestant. Employed, but available short notice.
Box 58-N-11, Ind. & Eng. Chem., Easton, Pa.

Industrial News



CONTINUED FROM PAGE 1489

War Emergency Pipe Line to Carry Crude

THE new 24-inch war emergency pipe line, now being constructed from Longview, Tex., to Salem, Ill., is the largest-diameter line carrying crude oil ever built and will establish records, both for size and for speed of construction.

The pipe is wrapped with a special asbestos felt, manufactured by The Philip Carey Mfg. Co., Cincinnati, Ohio, by a machine which first applies a waterproofing coating as the pipe revolves.

Motor-Driven Starting Pump

A NEW motor-driven starting pump for high pressures has been developed by the Watson-Stillman Co., Roselle, N. J. This compact unit is designed for primary or auxiliary service. It may be used with marine Diesel engines as well as stationary Diesel engines in power plants, commercial buildings, and water works.

Synthetic Rubber Plant

A SUBCONTRACT, at less than $3,000,000, for the erection of 35 concrete structures for a synthetic rubber plant in an east central state has been awarded to The Rust Engineering Co., Pittsburgh, Penna. The structures will include administrative buildings, warehouses, service and processing buildings. The subcontract was awarded by the Koppers Co., which will also operate the plant on lease. The plant will convert grain alcohol to butadiene and will also produce styrene.

Thermoplastic Lining for Steel and Concrete Tanks

AMERCOAT, a plastic-base coating composed of thermoplastic resins, makes it possible to use concrete as well as steel for tanks and vats for storage of fluids which ordinarily would cause severe corrosion or costly seepage.

Concrete tanks are now being used to store millions of barrels of Diesel fuel at strategic points. Amercoat adheres tightly to the concrete surface and is impervious. It produces a smooth, inert surface which is plastic enough not to check, crack, or fracture when subjected to vibration and moderate expansion and contraction.

Amercoat is manufactured by the American Pipe and Construction Co., P. O. Box 3428, Terminal Annex, Los Angeles, Calif.

New Surface Coating Resin

THE Plastics Division of Carbide and Carbon Chemicals Corp., 30 East 42nd St., New York, N. Y., announces a new and improved type of vinyl resin for corrosion-resistant maintenance finishes and other coating applications. The new resin, identified as vinylite resin VMCH, is characterized by improved adhesion to a wide variety of surfaces, making possible the formulation of air-dry or low-bake coatings, which possess outstanding resistance to corrosion chemicals, to moisture, and to extreme weathering.

The new resin is similar to the vinyl chloride-acetate resins in most of its properties and differs only in containing a small amount of an additional ingredient that promotes the development of adhesion. It is completely compatible with the other grades, and may be blended with them in actual use.

Explosive Rivets

EXPLOSIVE rivets, introduced a year ago to break one bottleneck in aircraft production, now are speeding field repairs of damaged planes at military depots, E. I. du Pont de Nemours & Co. has announced.

A bomber or pursuit plane with a gash in its wing or bullet holes in its fuselage can be patched quickly without any dismantling by using these rivets. Repairs which formerly required days now are completed in hours.

Scrap

MORE than 3,700,000 pounds of scrap materials have been collected and sold for use in war production by the American plants of Monsanto Chemical Co.

Monsanto's salvage department has reported that 3,200,000 pounds of scrap iron alone have been collected in the campaign which was started last spring. This is enough scrap iron to make steel for one hundred fourteen 26-ton medium tanks or almost a million Garand rifles.

Light-Weight Dust Respirator

THE new Willson No. 10 respirator is one of the lightest weight respirators ever to receive U. S. Bureau of Mines approval.

It is practical for long periods of time without impairing workers' efficiency. Unusual breathing freedom is provided through specially designed inhalation and exhalation valves. The manufacturer is Willson Products, Inc., 220 Thorn St., Reading, Penna.

Scrap from Office Equipment

TONS of scrap rubber and metal, in obsolete or unused office equipment, represent an untapped reservoir for the Nation's salvage drive, Ralph B. McKinney, in charge of the Hercules Powder Co. salvage campaign, said. A survey within the company's main offices turned up about 2 tons of valuable scrap metals.

BUSINESS OPPORTUNITIES • FOR SALE • WANTED • ETC.

MISCELLANEOUS

Five cents a word, minimum charge $2.00; display available at $7.50 per inch; in advance. No discounts or allowances

MICRO-ELEMENTARY ANALYSES: C, H, N, S, P, Halogens, Methoxyl, Mol. wt., etc., U.S.P. and other official tests, Purity tests, Microinorganic assays, Spot tests, Micro-distillations, Toxicological investigations, and typical micro-chemical research work. Dr. Carl Tiedcke, 366 Fifth Avenue, New York, N. Y.

WANTED: Journal of American Chemical Society, Vol. 1–25 inclusive or set of several volumes ending with Vol. 25.
Box 22–T–10, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Chemical Periodicals sets, volumes and back copies, Domestic and Foreign. B. Login & Son, Inc., 29 East 21st Street, New York City.

FOR SALE: Abstracts, Journals, Industrial and Analytical Edition. 90% complete, 1920–1938. Unbound, good condition. Make offer for quick disposal.
Box 14–N–11, Ind. & Eng. Chem., Easton, Pa.

FOR SALE—Unbound, clean, in order, 31 Vol. (1911–1941) Journal, American Chemical Society, 31 Vol. Abstracts, 31 Vol. Industrial & Engineering Chemistry, 13 Vol. (1–13) Analytical Edition, First Decennial Index, 31 Vol. (1911–1941) Journal, Society Chemical Industry (English), 31 Vol. Weekly publication Chemistry & Industry (3 copies missing), sell as lot $450.00 if called for New York City. To purchaser, 21 Vol. (1920–1941) Monthly publications American Pharmaceutical Association, at no cost.
Box 15–N–11, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Journal of Biological Chemistry Vols. 1–10, 18, 22–23; unbound. Journal of General Physiology vols. 1–22; bound. Will sell for highest bid.
Box 16–N–11, Ind. & Eng. Chem., Easton, Pa.

WANTED TO BUY: Second hand Electroliser in excellent condition for the production of Hydrogen and Oxygen (120 cells, 240 Volts, 200 Amperes) or 2 Electrolisers (each 60 Cells, 110–120 Volts, 200 Amperes).
Box 24–N–11, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: established and recognised commercial testing laboratory with complete physical and chemical equipment in Kansas City. Excellent opportunity for private management or branch of national organization.
Box 25–N–11, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Soc. Chem. Ind. 1904–1911 incl. Jour. Amer. Chem. Soc. 1904–1908 incl. Review of Amer. Chem. Researches Vols. 10, 11 and 12. The Chemical Engineer Vols. 5, 6, 7, 8. All bound.
Box 27–N–11, Ind. & Eng. Chem., Easton, Pa.

WANTED: Following numbers Journal Textile Institute or complete volume each year listed: 1910—Number 1; 1913—1, 2; 1914—1, 2, 3, 4; 1916—2; 1917—1, 2, 3, and Index; 1921—1, 2, 3; 1922—8, and Index; 1923—1, 2, 4, 5. Harold DeWitt Smith, 47 East 88th St., New York, N. Y.

FOR SALE—National Geographic magazines, 1916–1941 inclusive, unbound, complete, fine condition, $60; Also, any other issue of the National Geographic 1888–1942, Readers Digest, 1930–1941 inclusive, $18, Fortune, 1930–1941 inclusive, $90; Any magazine, Asia, Time Antiques, Theater Arts, Time Life, Scientific Periodicals, chemical, medical physical, send want list, no obligation. Periodical Service, Box 327, Swarthmore, Pa.

FOR SALE: Active commercial laboratory business; centrally located, long successful in industrial agricultural area; excellently equipped. Metallurgical analysis for war plants, the present chief activity; but equipped also for other lines.
Box 50–N–11, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: set Chemical Abstracts with 3 Dec. Indexes, bound, Chemisches Zentralblatt 1897 to 1925. Set Physical Reviews, Berichte, General Registers only, Journal Society Chemical Industry 1903 to 1939.
Box 63–N–11, Ind. & Eng. Chem., Easton, Pa.

FOR SALE—Sterilising Autoclaves, Horizontal or vertical small and large models are now available in stock for immediate delivery. No priority needed. Write for full details. The Laboratory Exchange, 24 East 21st Street, New York City.

FOR SALE—New labtest hydraulic press, 10 tons' capacity, 6 x 6 platens, self-contained, with or without electrically heated platens. Ready for immediate delivery. Write for further details. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

FOR SALE—Balances, new pulp balances, 150 gr. capacity. 1 mg sensitivity, in fine polished case. Ready for immediate delivery. A splendid opportunity to obtain these without delay at $27.50. Write for further details, The Laboratory Exchange, 24 East 21st St., N. Y. C.

FOR SALE—Microscopes, Microtomes, Centrifuges, Schmidt & Haensch Saccharimeters, McMichael Viscosimeter. Agate Mortar Grinder, Mullen Jumbo tester, also smaller model. Freas Ovens, Voland Assay Balance, Torsion scales, dark field condensers, mechanical stages, large incubators, ball mills, Weston meters, spectrophotometer, stills, etc. Write us your needs for immediate quotations, The Laboratory Exchange, 24 E. 21st St., N. Y. C.

WANTED TO BUY—Offer us your surplus laboratory equipment. No better time to dispose of those idle pieces than now. Modern war requires these now. Our prices are very high. Send us your lists, prompt offers will be made. The Laboratory Exchange, 24 E. 21st St., New York City.

FOR SALE: Organic Halides and Polyhalides, Organic Selenium Compounds. 100 pounds Sodium Cacodylate. 5 Kilos each dl Alanine, Cystine and Histidine. Other organics. Gentiobiose, d-Ribose, Arabinose, Fucose, Sorbose, Levulinic Acid, Galacturonic Acid, Tyrosine, 50 Tellurous Acid C. P.
Box 75–N–11, Ind. & Eng. Chem., Easton, Pa.

NEED EQUIPMENT? Then contact The Laboratory Exchange at New York, write, wire or phone. Whatever your needs are in laboratory equipment. Your inquiry will receive immediate attention. We have served American chemistry for ten years with fine used guaranteed equipment. Reasonably priced. The Laboratory Exchange, 24 E. 21st St., New York City.

WANTED: "Chemical Abstracts": Vol. 2 (1908) Nos. 1, 2, vol. 3 (1909) Index number, paying $5—per number; "Transactions, American Electrochemical Society": all or any of vols. 41–80 (1922–1941). Dr. G. H. Fransius, 201 East 82nd Street, New York, N. Y.

FOR SALE: 500 grams Uranium Carbide Salts of Boron, Beryllium, Barium, Cerium, Gallium, Germanium, Iridium, Lanthanum, Praseodymium, Zirconium, Iron Carbonyl, 10 pounds Ceylon Sapphires Uncut, 100 Zircon Crystals Cut.
Box 76–N–11, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL AND ENGINEERING NEWS
HARRISON E. HOWE, Editor
PUBLISHED BY THE AMERICAN CHEMICAL SOCIETY
VOLUME 20 NOVEMBER 25, 1942 NUMBER 22

The Economic Status of the Members of the American Chemical Society (Continued[1])

Approved Report of the Committee on Economic Status

George Calingaert, Walter A. Schmidt, Walter G. Whitman, Frank C. Whitmore, L. W. Bass[2], Chairman

Prepared for the Committee by Andrew Fraser, Jr., Washington, D. C.

General Characteristics of Sections 4 to 8 Inclusive

In the ensuing five sections, analyses are made of the information furnished by the membership with respect to annual income, monthly salary rate, occupational status, source of employment, and field of specialization.

The mode of analysis is exactly the same. The first part of each section contains a discussion of the membership as a whole without regard to the years in which the members reported they had entered the profession. This is followed by a treatment of the same information in relation to year of entering the profession, which, in the text, is used interchangeably with years of professional experience.

The number of responses to each of the five topics is probably the best measure of the cooperation of the membership. The extent of the response in the period 1926 to 1934 exceeded the most sanguine hopes of the committee. Actually, in each of the four years in this period for which data were requested, at least 90 per cent of the replies were usable. For the five years subsequent to 1934, which cover the period 1937 to 1941, the usable returns averaged as high as 95 per cent.

The fact that such a high percentage of the membership cooperated made it possible to extend the scope of the report far beyond what was originally planned. This extension has reference particularly to monthly salary rates. Following Section 8 these rates are discussed in relation to each variable in the questionnaire.

In the analyses of annual incomes and monthly salary rates, variation in the text is made possible by interchangeability of terms; for example, both incomes and rates are sometimes referred to as earnings. Furthermore, the comparisons of income and rates are generally made among five levels of earnings, designated, respectively, "median", "upper and lower quartiles", and "upper and lower deciles". In the text the median level is sometimes referred to as the 50 per cent earnings level. Above and below this point, in a particular year, 50 per cent of the membership earned more than and 50 per cent earned less than the specified amount.

The upper quartile, or the 25 per cent earnings level, denotes that 25 per cent of the membership earned more than and 75 per cent earned less than a specified amount, whereas the lower quartile, or 75 per cent earnings level, denotes that 75 per cent earned more than and 25 per cent earned less than the designated income or rate. The upper and lower decile are referred to, respectively, as the 10 and 90 per cent earnings levels. The first measure means that 10 per cent of the members in a particular year earned more than and 90 per cent earned less than the specified amount. In contrast, reference to the latter measure indicates that 90 per cent earned more than and 10 per cent earned less than the specified amount.

It should also be noted that the measures for the median earnings were computed only if 10 or more members reported. The computation of the earnings measures for the upper and lower quartiles required that data be reported by 50 or more members. In the case of the upper and lower deciles the requisite measures were not computed unless 100 members furnished reports on either annual incomes or monthly salary rates.

Those who are interested in translating the findings to an age basis need merely add 23 years to the number of years of professional experience. This relationship was established by correlating the year of birth and the year of entering the profession reported by a substantial number of male regular members and computing the median age for the group. This was found to be 23 years. The five age groups used in this particular test ranged from under 19 years of age at entrance into the profession to 35 years of age and over, but no less than 80 per cent of the group were found in the class 20 to 24 years of age.

Section 4. Annual Incomes of the Membership

The data collected in this survey for the period 1926 to 1941, particularly with regard to annual incomes and monthly salary rates of the membership, are unprecedented in one important respect. For the first time information has been obtained which makes it possible to trace the earning capacities of a professional group of workers over a period of cataclysmic changes in the economic activities

1 UNDER $1,200 2 LESS THAN 62.1 PERCENT

of the United States. The figures reflect, for example, the effects of the boom period 1926 to 1929. They also reveal how the earnings capacity of the membership was affected by the great depression, the influence of which was essentially operative in the period 1929 to 1934. The data reported for the years 1937 and 1938 are an indication of the uncertainties of economic activity during that time. On the other hand, the information furnished for the most recent years of 1939, 1940, and 1941 reflects the increasing tempo of industrial production that stemmed from prewar preparedness and eventual participation in the conflict.

Considered without regard to years of professional experience, the median annual income (Table 6), including salary, fees, and bonuses of all members reporting in 1941, was $3,364. This means in that year 50 per cent of the membership earned more than this amount and 50 per cent earned less. In this same year, while 25 per cent of the membership had annual incomes in excess of $4,943, 10 per cent had earned more than $7,978. By contrast, annual incomes of less than $1,932 and $2,498 were reported by, respectively, one tenth and one quarter of the membership.

Over the period 1926 to 1941 the fluctuations in earnings followed a consistent pattern. This situation is exemplified by considering the 50 per cent levels of the membership reported for each of the nine years.

Between 1926 and 1929, while the median incomes of the membership increased by $153 from $2,972 a year to $3,125 a year, from 1929 to 1932 they declined by $289. By 1934, however, annual incomes had declined by another $143. In that year, the actual median earnings reported were $2,693 a year.

Subsequent to 1934 the annual incomes of the membership began to rise. Over

TABLE 7.—COMPARISON OF 5 LEVELS OF ANNUAL INCOMES IN PERIOD 1926 TO 1941 OF ALL MEMBERS REPORTING, BY YEAR OF ENTERING PROFESSION

YEAR OF AND YEARS AFTER ENTERING PROFESSION		PROPORTION WITH ANNUAL INCOMES OF MORE THAN SPECIFIED AMOUNT				
		10 PER-CENT	25 PER-CENT	50 PER-CENT	75 PER-CENT	90 PER-CENT

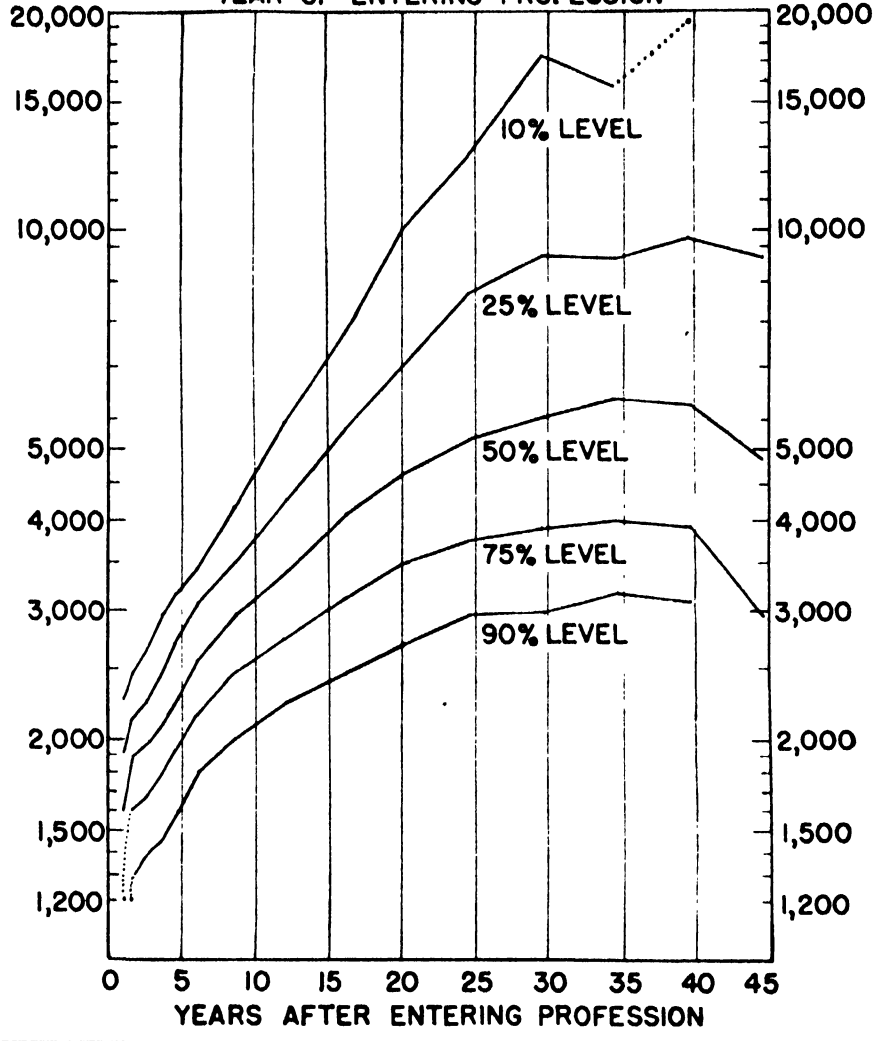
The AMERICAN CHEMICAL SOCIETY assumes no responsibility for the statements and opinions advanced by contributors to its publications.
Published by the AMERICAN CHEMICAL SOCIETY, Publication Office, 20th & Northampton Sts., Easton, Penna. Editorial Office, 1155 16th St., N. W., Washington, D. C.; Telephone, Republic 5301; Cable, Jiechem (Washington). Advertising Department, 332 West 42nd St., New York, N. Y.; Telephone, Bryant 9-4430. Entered as second-class matter at the Post Office at Easton, Penna., under the act of March 3, 1879, as 24 times a year on the 10th and 25th. Acceptance for mailing at special rate of postage provided for in Section 1103, Act of October 3, 1917, authorized July 13, 1918.
Annual subscription rate, $2.00. Foreign postage to countries not in the Pan American Union, $0.60; Canadian postage, $0.20. Single copies, $0.15. Special rates to members.
No claims can be allowed for copies of journals lost in the mails unless such claims are received within 60 days of the date of issue, and no claims will be allowed for issues lost as a result of insufficient notice of change of address. (Ten days' advance notice required.) "Missing from files" cannot be accepted as the reason for honoring a claim. Charles L. Parsons, Business Manager, 1155 16th St., N. W., Washington, D. C., U. S. A.

the period 1934 to 1941 the increases occurred at varying rates. From 1934 to 1937, for example, median incomes rose on the average at the rate of $44 a year. Between 1937 and 1940, on the other hand, the yearly rate of increase in earnings was $120. Over this period the incomes actually reported rose from $2,825 a year in 1937 to $3,186 a year in 1940. From 1940 to 1941, however, annual incomes of the membership increased almost one and one-half times as fast as in the preceding period, rising from $3,186 a year in 1940 to $3,364 in 1941, or an increase of $178.

This pattern of fluctuation in earning capacity was common to each of the other four earnings levels. Furthermore, at all corresponding levels in earlier years the annual incomes reported were without exception less than those for 1941.



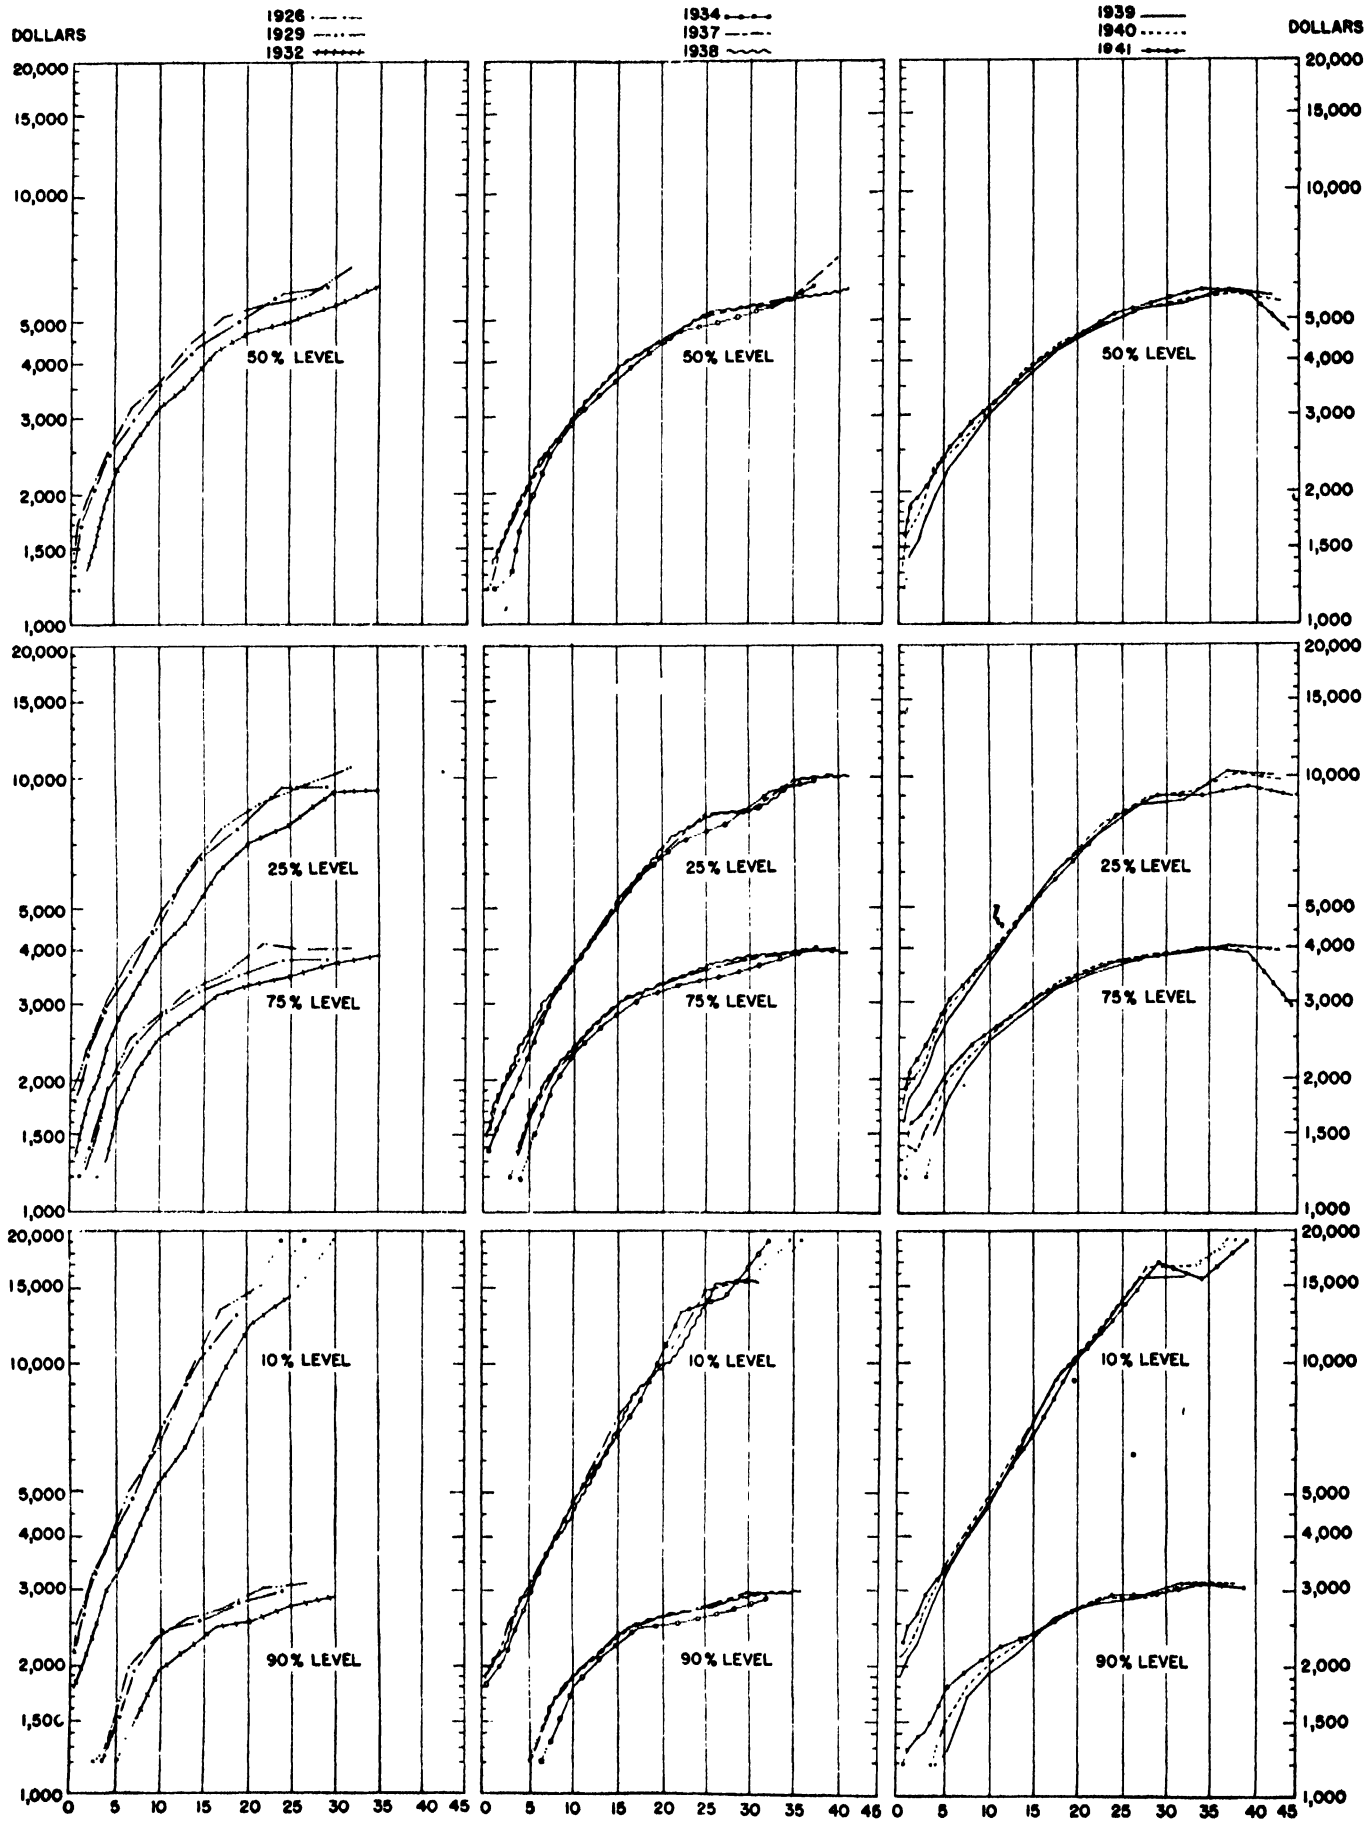
In 1926, for example, the median annual income of $2,972 a year was 11.7 per cent less than the median earnings of $3,364 a year reported for 1941. At this same level, but in 1934, the difference relative to 1941 was 19.9 per cent. Similar comparisons for these two periods show that at the 10 per cent earnings level the differences were 6.8 per cent and 17.3 per cent. At the 90 per cent level the annual income in 1926 was 30.8 per cent less than that reported for 1941. In 1926, while one tenth of the membership earned more than $7,435 a year, one tenth earned less than $1,336 a year. The annual income reported at the upper 10 per cent level in 1934 was $6,594 a year. At the upper and lower quartile levels in 1926 the annual incomes were less, respectively, by 9.6 per cent and 18.6 per cent than those reported in 1941. At these same two levels in 1934 the earnings differences relative to 1941 were 17.3 per cent and 32.7 per cent. Over the period 1934 to 1940 these differences in annual incomes relative to 1941 progressively declined at all five earnings levels.

Analysis of the data in Table 6 shows also that, over the period 1926 to 1941, the relationships that existed between the median annual income levels and the two upper and two lower income levels remained fairly constant. In each of the nine years the upper decile and upper quartile incomes of the membership reporting were, on the average, respectively, 2.4 and 1.5 times greater than the median incomes. The lower quartile and lower decile incomes, on the other hand, were less than their respective median incomes by approximately one third and one half.

To evaluate properly this broad picture of changes in the economic status of the membership with respect to annual incomes it is necessary that the data be analyzed in relation to years of professional experience (Table 7).

These data show that, in each of the nine years in the period 1926 to 1941 and at all five income levels, the earnings capacity of the membership increased with experience, and at any point in a particular experience span the spreads in earnings were considerable. These characteristics are exemplified by considering the incomes reported for 1941 in Table 7 as well as those plotted in Chart 1.

CHART 1- ANNUAL INCOMES IN 1941, INCLUDING SALARIES, FEES AND BONUSES, OF ALL REPORTING MEMBERS ACCORDING TO YEAR OF ENTERING PROFESSION



In 1941 the median income of those members who had just begun their professional careers was $1,600 a year. At succeeding levels of experience annual incomes at this same level steadily increased and reached a maximum of $5,818 a year for those members who in 1941 had been professionally active for 35 years. At approximately five and nine years beyond this point the median incomes had declined to $5,500 a year and $4,800 a year, respectively. The steady advance in earning capacity to a maximum after 35 years of professional experience was common to the lower quartile and the lower decile levels. At the former earnings level the range in annual incomes over the 35 years' experience span was from under $1,200 to $4,017, whereas at the latter level, while beginning annual incomes were also under $1,200, the maximum annual earnings reached after the same number of years of experience was only $3,162.

In contrast to this situation, annual incomes reported in 1941 at the upper decile and upper quartile levels reached maxima five years later, or after members had been professionally active for approximately 40 years. In 1941 the annual incomes of 10 per cent of the members with 40 years' experience exceeded $19,200; 25 per cent earned more than $9,694.

The spreads in earnings in 1941 at particular years of professional experience are more readily interpreted by referring to Chart 1. The data in this form clearly indicate that, up to five years after entering the profession, the spreads in earnings remained fairly constant. After five years of professional experience 50 per cent of the membership in 1941 was earning over $2,450 a year and 50 per cent was earning less. The annual incomes of one fourth of this same group of members were $450 greater than the median, or $2,900 a year; and one fourth earned $400 less than the median, or $2,050 a year. At the decile levels the earnings of 10 per cent

CHART 2 - ANNUAL INCOMES IN PERIOD 1926 TO 1941, INCLUDING SALARIES, FEES AND BONUSES, OF ALL REPORTING MEMBERS ACCORDING TO YEAR OF ENTERING PROFESSION

exceeded the median income by $850 or more, or $3,300 a year, while 10 per cent were lower than the median by $750 or more, or $1,700 a year.

With lengthening experience, the spreads in annual incomes reported in 1941 became accentuated, especially at the upper 10 per cent and the upper 25 per cent earnings levels. Thus, after 10, 20, and 30 years of professional experience, while the incomes of the upper one fourth of the membership were greater than the median of their groups by, respectively, 20, 42, and 65 per cent, the corresponding differences for the upper one tenth of the membership were 40, 120, and 206 per cent. By contrast, at the 75 per cent earnings level the differences relative to the median were of the order of 18, 25, and 30 per cent, and at the 90 per cent earnings level they were of the order of 33, 42, and 46 per cent.

After 10 years' professional experience, Chart 1 shows also that the median annual income reported in 1941 was $3,180 a year. One quarter of this same group earned more than $3,800 a year, one quarter less than $2,600, one tenth more than $4,400, and one tenth earned less than $2,130 a year. The median annual income of members with 20 years' experience in 1941 was $4,650, and of those with 30 years' experience was $5,550. In other words, relative to the 50 per cent earnings level of $3,180 a year reported by members who had been in the profession for 10 years, the earnings capacity with 20 and 30 years of experience were, respectively, 1.5 and 1.8 times as great.

At the upper 10 per cent earnings level, however, members with 30 years' experience were earning more than $17,000 a year, or nearly four times as much as members at this level with only 10 years' experience. The corresponding difference at the lower 10 per cent earnings level was only 1.4. At this level members who had been professionally active for 30 years reported annual incomes of $3,000.

Similar comparisons of the incomes at the upper and lower quartile levels show that at the former level the earnings of $9,200 a year for members with 30 years' experience were 2.4 times as great as the earnings of $3,800 a year reported by members who had been professionally active for 10 years. At the lower quartile level members with 30 years' experience were earning $3,900 a year, or 1.5 times as much as the annual income of $2,600 a year of members with only 10 years' experience.

In each of the eight years prior to 1941 that cover the period 1926 to 1940, Chart 2 makes evident that the spreads and rates of growth in the annual incomes of the membership did not differ materially from those noted above for 1941. From this chart, general comparisons readily can be made among the earnings reported for comparable years of experience to illustrate the changes which occurred over the whole period 1926 to 1941. It should be emphasized, however, that since annual incomes do not measure rates of earnings, conclusions derived from Chart 2 must be used with caution as measures of economic status. This qualification is important because the basic data, which include salaries, fees, and bonuses, are affected by the volume of employment.

With the exception of the lower decile earnings level after five years of experience, Chart 2 shows that, for comparable years of experience, the annual incomes of the membership at all five income levels were consistently lower in 1941 than the incomes reported for 1926 and 1929; and in general the lowest incomes reported were those for the year 1934.

For example, after five years of professional experience, the range in median annual incomes over the period 1926 to 1941 was $775. The lower extreme of this range included annual earnings of $1,875 reported for 1934, while the upper extreme refers to earnings of $2,650 a year reported for 1926. The latter earnings were, however, $250 a year greater than the median annual income of $2,400 earned by members who in 1941 had had five years of professional experience. For the same experience span, the range in incomes at the lower quartile level was $750. At this level the lowest income reported was $1,400 a year in 1934; the highest, $2,150 a year in 1926. Again these 1926 earnings were more than those of $2,050 a year reported for 1941. At the two higher earnings levels, the ranges in incomes over the period 1926 to 1941 each exceeded $1,000. Thus, after five years of professional experience in 1934, while one quarter of the membership was earning $2,350, members with a similar experience span in 1929 were able to earn $3,380 a year, but in 1941 they were earning approximately 13 per cent less than this amount, or $2,950 a year. At the upper 10 per cent level, the earnings in 1941 were nearly 23 per cent less than those reported for 1926; the range in earnings over the 15-year period was also greater. Actually, at this level, annual incomes ranged from $2,850 in 1934 to $4,200 in 1926, but in 1941 the incomes of one tenth of the membership with five years of professional experience only exceeded $3,250 a year.

Similar comparisons of the data reported by members who had been professionally active for 20 years show that, over the period 1926 to 1941, median annual incomes in 1941 were $4,550 in contrast to $5,300 in 1926 and $4,350 in 1934. These figures show that over the 15-year period the range in annual incomes was $950, and that the median income reported for 1941 was approximately $750, or 14 per cent less than that of members with similar years of experience in 1926. At the two lower income levels, on the other hand, while annual earnings in 1941 were less than those reported for 1926 by approximately 10 and 7 per cent, the corresponding differences at the upper quartile and upper decile levels were, respectively, 21 and 30 per cent. To illustrate this, the movements in earnings at the upper and lower 10 per cent income levels are contrasted. At the latter level, the actual range in earnings between those of $2,660 a year in 1941 and $2,850 in 1926 was $190, whereas at the former level the actual range was as great as $4,100 and is derived from annual incomes of $14,000 and $9,900 reported, respectively, for 1926 and 1941.

From the preceding comparisons of incomes reported for corresponding years after entering the profession it seems to be indicated that members with few years of professional experience in 1941 were moving away from the low levels of earnings in 1934 and approaching the high earnings levels of 1926 and 1929 at a relatively much faster rate than the members with long years of experience. To establish this situation more precisely it is necessary next to consider the monthly salary rates also reported by the membership.

Section 5. Monthly Salary Rates of the Membership

The monthly salary rates presented in Table 8 without regard to years of professional experience for each of the nine years in the period 1926 to 1941 are, according to the instructions of the

questionnaire, the rates received by the membership for the time they were actually employed in their major fields, and are exclusive of fees and bonuses.

In 1941 the median salary rate of the membership was $271. Above this level, one quarter had earnings in excess of $383 a month, and one tenth earned more than $558 a month. On the other hand, while one tenth earned less than $159 a month, one quarter earned less than $205 a month.

The fluctuations in monthly salary rates of the membership over the period 1926 to 1941 were exactly similar in pattern to those previously noted in the similar discussion of annual incomes without regard to age. Thus, earnings rose from 1926 to 1929, declined over the period 1929 to 1934, and steadily increased from 1937 to 1941.

Over these periods the rates of increase in median monthly salaries varied. This is evidenced by noting that while monthly earnings rose by $11 from $238 in 1926 to $249 in 1929, in the succeeding five-year period they declined by $33 to reach $216 in 1934, but rose again by $8.00 to reach $224 by 1937. In each of the years in the period 1937 to 1940, however, the rate of increase in median monthly salary rates was as great as it had been over the whole period 1934 to 1937. In 1940, 50 per cent of the membership was earning more than $252 a month and 50 per cent was earning less. From 1940 to 1941 the rate of increase in median monthly earnings was nearly twice as great, in that they increased by $19 from $252 a month to $271 a month.

Relative to 1941, the differences in median monthly earnings in each of the prior years were less by amounts that ranged from 8.1 per cent in 1929 to as high as 20.3 per cent in 1934. A similar situation also prevailed at the two upper and the two lower earnings levels.

Also in each of the nine years while the upper decile and upper quartile monthly incomes of the membership reporting were on the average, respectively, 2.1 and 1.4 times greater than the median monthly incomes, the lower quartile and lower decile earnings were less than the median earnings by approximately one third and one half.

The fact that these average relationships differ from those previously noted for annual incomes only at the two upper income levels would seem to indicate that the earnings capacity of the membership at the median and two lower income levels is primarily dependent upon salary, and salary only. This statement is partially substantiated by considering the ratios of annual incomes to monthly salary rates (Table 8).

For each of the nine years in the period 1926 to 1941, median annual incomes of

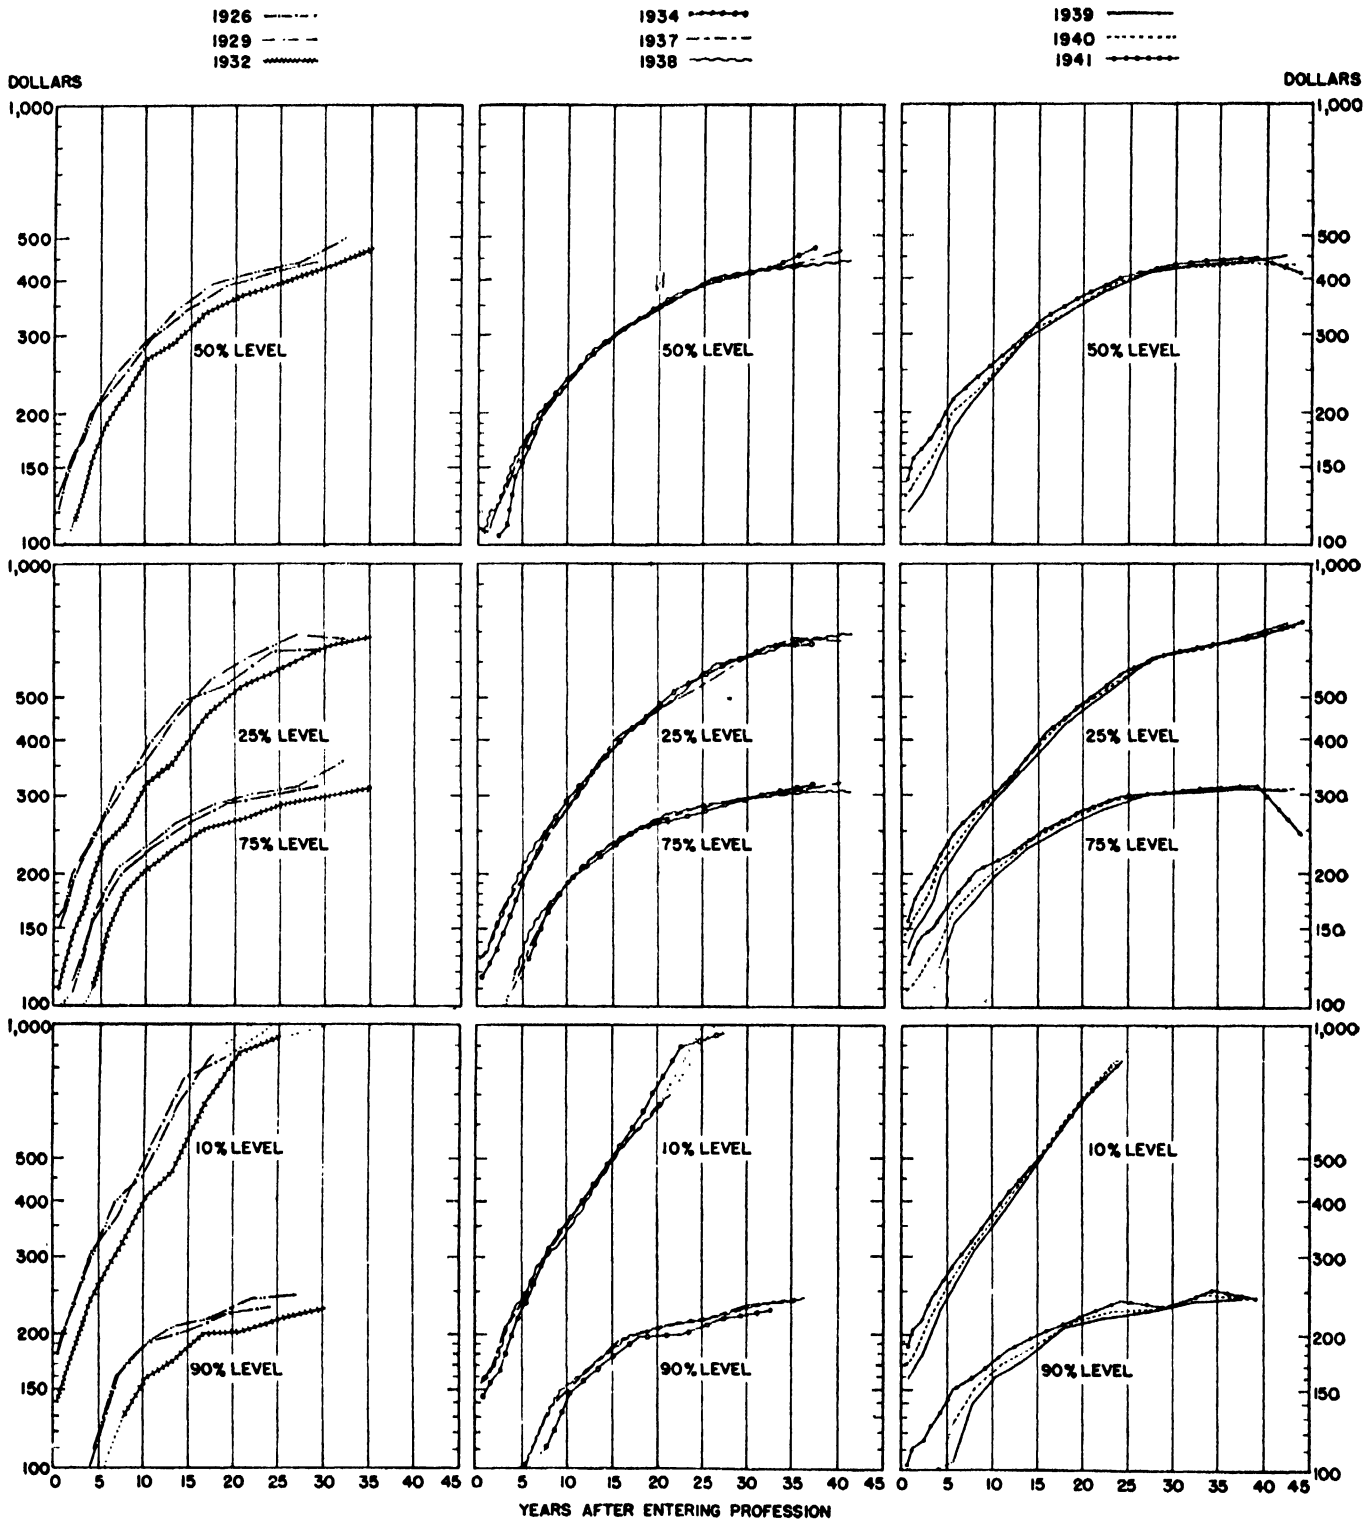
1 PRIOR TO 1900 2 FEWER THAN 100 MEMBERS REPORTED 3 OVER $1,000 4 UNDER $100

the membership averaged 12.5 times the corresponding median monthly salary rates. This means that over the period 1926 to 1941, the median annual incomes were on the average only 4 per cent greater than 12 times the median monthly earnings. At the two lower earnings levels, the margins were less even than that noted for the median level, averaging 2 per cent. By contrast, members located at the upper quartile level of earnings were averaging 10 per cent more income than 12 times the monthly rate which they reported for their regular professional work. At the upper 10 per cent earnings level, however, the corresponding differential was as great as 20 per cent.

When related to years of professional experience, however, these differentials show considerable variation. Thus in 1941 after three years of professional experience, the annual incomes (Table 7) were approximately equal to 12 times the monthly salary rates (Table 10) at all five earnings levels. After 24 years of professional experience, on the other hand, reported annual incomes at the upper decile level in 1941 exceeded 12 times the monthly salary rate reported at the same earnings and experience level by as much as 26 per cent. The corresponding differentials at the upper quartile, the median, and the lower quartile earnings levels were, respectively, 20, 8, and 4 per cent.

Essentially, the preceding comparisons also reflect the spreads in both annual incomes and monthly salary rates of the membership which occurred with advancing years of experience. In the case of monthly salary rates the median earnings in 1941, for example (Chart 3), advanced steadily from $140 a month for members just beginning their professional work to $445 a month for members who had been professionally active for 39 years. At the upper and lower quartile levels of earnings, entrance rates for the membership were, respectively, 16 per cent greater and 16 per cent less than the median entrance rates. After 39 years of experience, the upper quartile monthly salary rate had advanced from $156 a month to $684 a month, and the lower quartile rate had advanced from $125 a month to $317 a month. At this level of experience, while the upper quartile monthly salary exceeded the median salary rate of the group by 54 per cent, the lower quartile rate was 16 per cent less.

This situation was common to all years prior to 1941 for which the membership furnished information on monthly salary rates (Chart 4). In each of these eight years it is evident, too, that the spreads in earnings became more accentuated at the two upper earnings levels after five years of professional experience. From the data in Chart 4 figures have been derived whereby comparisons can be made of monthly salary rates for corresponding years after entering the profession (Table 11). These data are also plotted in Chart 5.



The data in Chart 5 substantiate the earlier statement that members with few years of professional experience in 1941 were moving away from the low levels of earnings of prior years and approaching the high levels of earnings of 1926 and 1929 at a relatively much faster rate than the members who had had longer years of experience. These data show also that at no level of earnings or experience in 1941 had the membership reached the monthly salary rates which obtained in

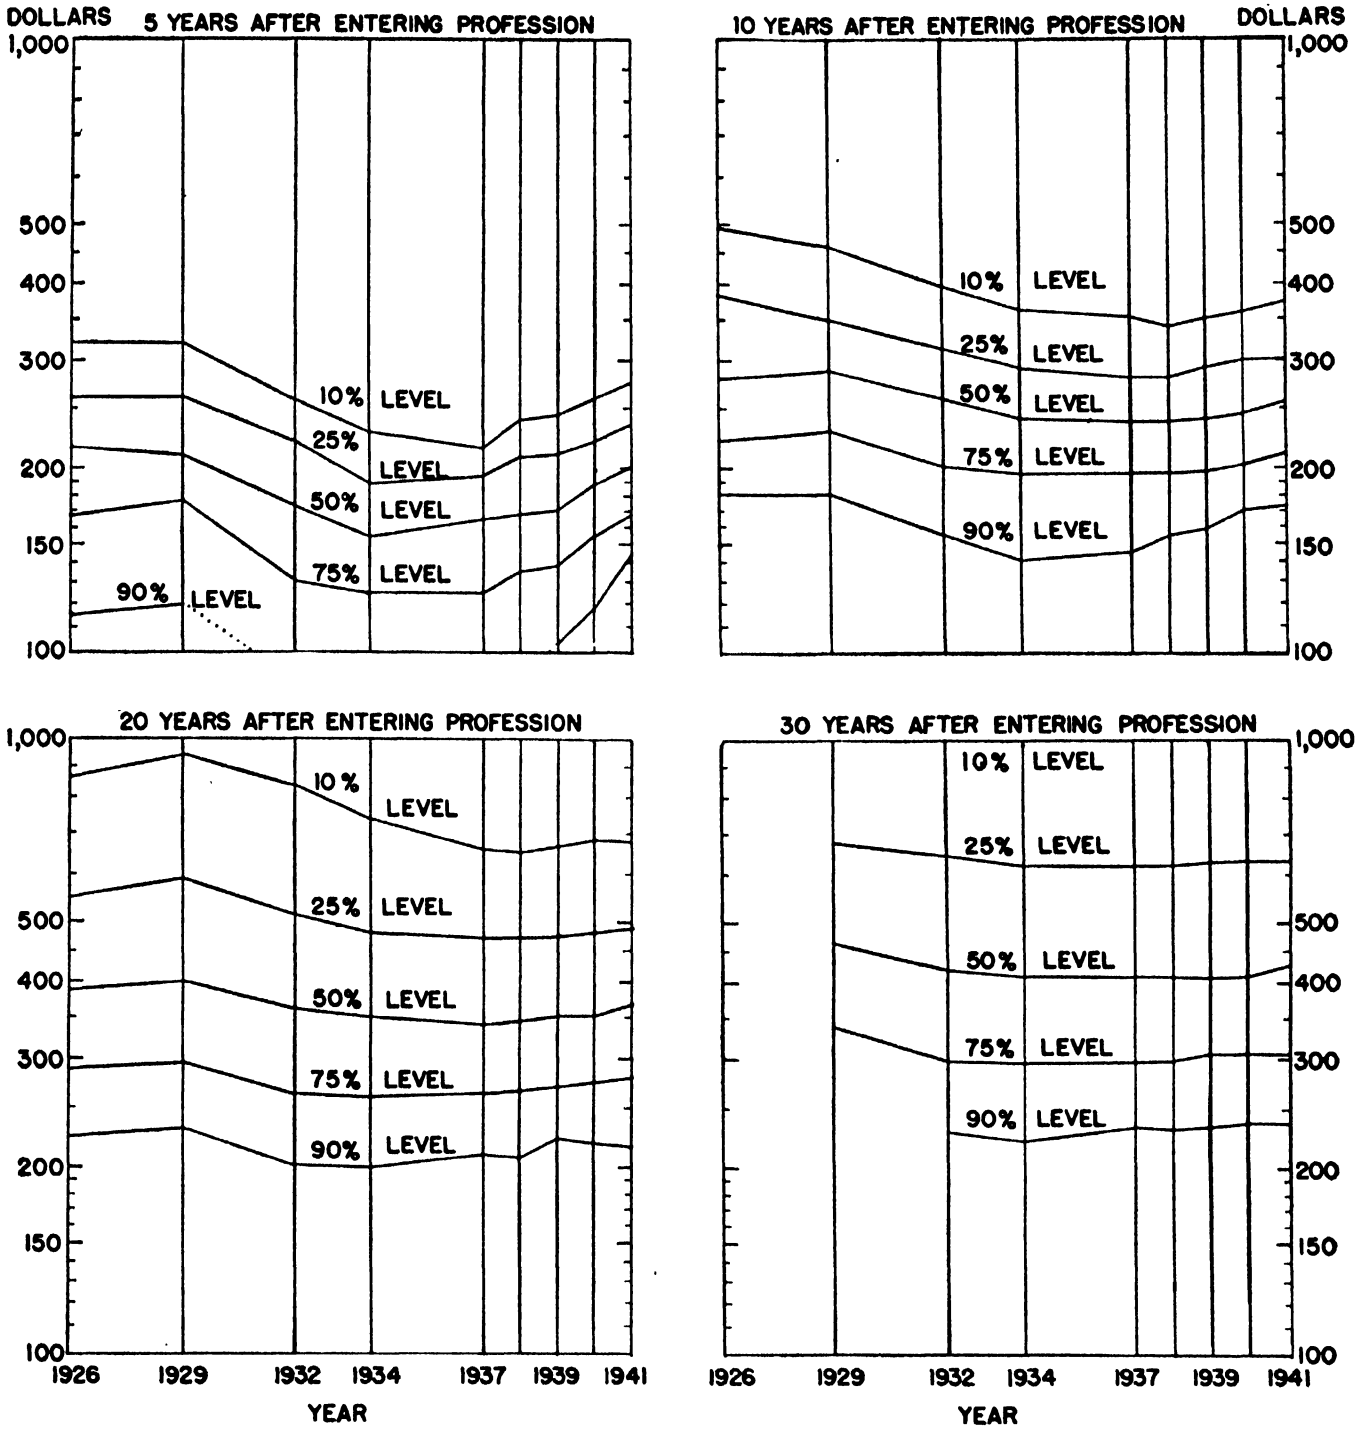
CHART 4-MONTHLY SALARY RATES IN PERIOD 1926 TO 1941 OF ALL REPORTING MEMBERS ACCORDING TO YEAR OF ENTERING PROFESSION

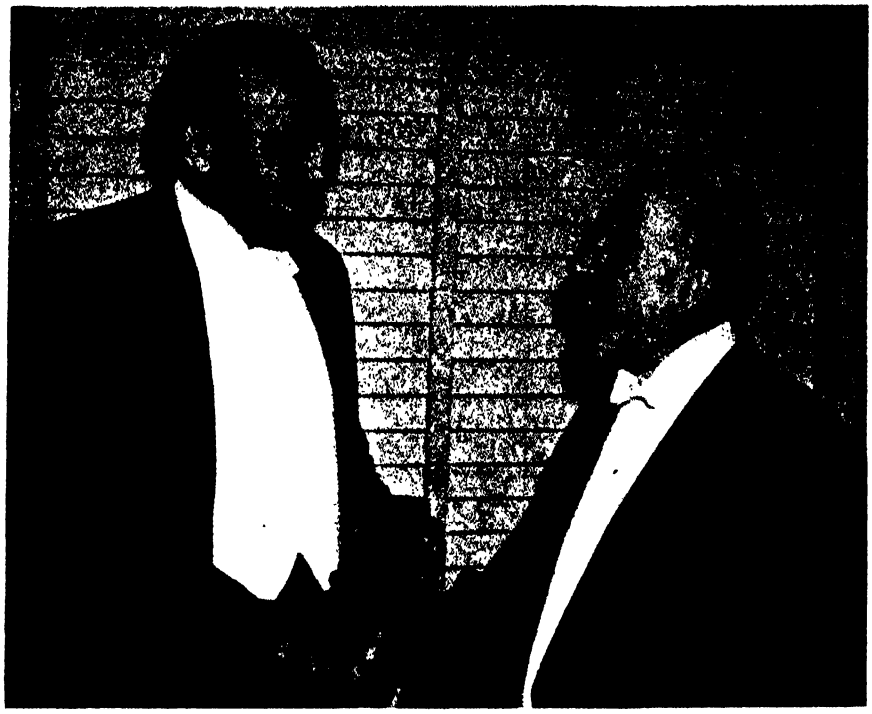


1929, except in the case of the 90 per cent earnings level after five years of professional experience. Despite the lack of data it is reasonable to assume that this movement was even more pronounced for members with experience spans of less than five years.

Another feature of the monthly salary rates shown in Chart 5 is that they clearly indicate how the low point of monthly salary rates of the membership varied with both the experience level and the earnings level. For example, for members with five years of professional experience both the decline and rise in earnings over the period 1926 to 1941 were quite sharp. The low point of median earnings of $154 a month for this experience level was reported in 1934. By 1941 the monthly rate had advanced to $200. These earnings, however, were less by $9.00 and $15 a month than those of members similarly situated in 1926 and 1929, respectively.

For members whose experience spans covered 10 years, the lowest median earnings reported were in 1937; they remained at this level through 1938 and rose to $257 a month in 1941. Again in 1926 and 1929 it will be noted that the earnings of

CHART 5 - MONTHLY SALARY RATES IN PERIOD 1926 TO 1941 OF ALL REPORTING MEMBERS FOR CORRESPONDING YEARS AFTER ENTERING PROFESSION



members with 10 years' professional experience exceeded those reported in 1941 by $30 and $21 a month, respectively.

At the 20 years' experience level the lowest point of median earnings was reached also in 1937. But in the case of members with 30 years of professional experience median monthly earnings remained stationary at $410 a month over the period 1934 to 1938. At neither of these experience levels did median monthly earnings exceed those reported by members with similar years of experience in 1926 to 1929.

In general, the preceding patterns of movements noted for median monthly earnings of the membership were paralleled at the two upper and the two lower earnings levels.

(To be continued in December 10 edition)

Chemical Industry Medal Presented to Howe

THE Chemical Industry Medal, one of the highest honors within the gift of chemical science, was presented to Harrison E. Howe, for more than twenty years editor of *Industrial and Engineering Chemistry* at a joint meeting of the New York Sections of the Society of Chemical Industry, the AMERICAN CHEMICAL SOCIETY, and the American Institute of Chemical Engineers held at The Chemists' Club in New York on November 6. Foster D. Snell, chairman of the New York Section of the Society of Chemical Industry, presided at the medal presentation ceremonies, as well as at the dinner which preceded them.

After the presentation, which was made by Lincoln T. Work, research director of the Metal and Thermit Corp. and immediate past chairman of the New York Section, Society of Chemical Industry, Gustavus J. Esselen, consulting chemist of Boston, spoke on the personal side of the medalist and Watson Davis, director of Science Service, told of Dr. Howe's professional achievements. A feature of this part of the program was a motion picture film that showed views of the medalist, most of them taken at scientific meetings, and ended with reproductions of several of the New Year's cards which he had distributed during the past few years.

Dr. Howe discussed chemistry in international affairs, calling particular attention to the contributions of chemists in making America strong for war and prosperous in peace, and withal, a better place in which to live. He spoke of the chemist's part in perfecting new raw materials to replace those which are now scarce or inadequate. He cited the work in vitamin fortification of foods and in food dehydration, and recalled such chemical triumphs of the past as the breaking of the Japanese camphor monopoly through the development of synthetic camphor, the release from dependence on German potash deposits through the opening up of American potash resources, and the discovery of a cheap process for the production of toluene from crude oil.

Data Published on Selective Service

BECAUSE of the wide interest in this subject and the need for obtaining trained men for our Production Army, we give below references to information we have published on occupational deferments, including those of men in training, and the need for technically trained persons. Future developments will be brought to the attention of our readers.

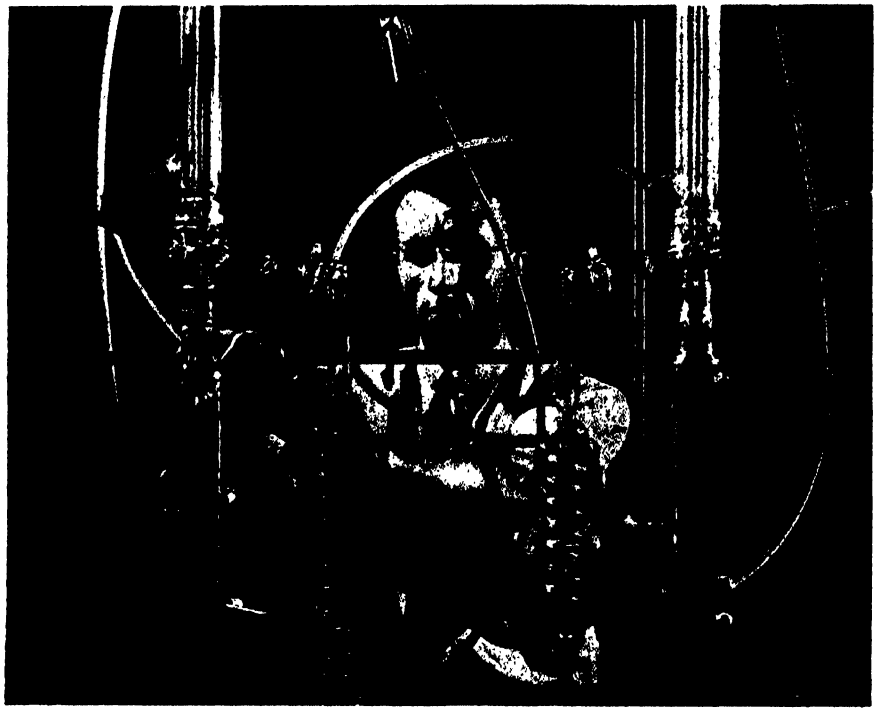
Plant of the Velsicol Corp.

Petroleum Resins

C. A. THOMAS, Monsanto Chemical Co., Dayton, Ohio

UNSATURATED hydrocarbons, so abundant in the United States as the result of enormous cracking operations of petroleum, have long been visualized as an inexpensive and readily available raw material for the manufacture of synthetic resins. Research in this country has been active in this field since 1928. Those connected with the development of synthetic resins and resinoids from petroleum soon realized the desirability of having a controlled raw material. The production of uniformly unsaturated hydrocarbons from a heterogeneous cracked distillate presented many difficulties, and the preparation of commercial resins from a petroleum source at an attractive cost was not easy.

Distillates obtained from cracking a low molecular weight hydrocarbon such as propane, butane, and the like at high temperatures and low pressures have a high degree of unsaturation and offer one of the best sources of reactive hydrocarbons. Careful analyses of the hydrocarbons produced under various conditions have been made. It has been found that such distillates are for the most part a mixture of olefins, diolefins, and aromatics, mainly substituted aromatics. The amounts of each constituent depend on the conditions of the cracking operation. When anhydrous aluminum chloride is added to such a distillate under controlled operation, a combination of chemical reactions such as condensation and polymerization takes place, resulting in a resin which is hard, amber-colored, and melts around 100° C. Many types of resins or resinoids can be produced, depending on the proportion of diolefins, olefins, and aromatics maintained in the distillate. These resins are still quite unsaturated and are therefore reactive with various other compounds. They oxidize readily when exposed in a thin film, and this property accelerates the gelation of chinawood and other varnish oils. These resins can



Santoresin 200 is a varnish resin which frequently finds application in many quick-drying varnishes and enamels.

be combined with drying or semi-drying oils for special purposes or used directly in a varnish kettle for producing quick-drying varnishes.

Other catalysts, such as sulfuric acid, activated clays, and boron trifluoride, may be employed. The resulting product varies according to the catalyst used. Several companies produce petroleum resins of these various types and their main outlet is in the paint and varnish industry. They are, however, finding uses in other fields, as constituents of printing ink, plastic tile, linoleum, laminates, and impregnated fibers.

The tendency in the past few years has been to employ pure or special mixtures of hydrocarbons to produce a certain resin. Ethylene itself can be polymerized under high pressure to produce a rubbery product reportedly having excellent electrical properties. Another hydrocarbon, isobutylene, when polymerized at sub-zero temperatures with boron trifluoride as a catalyst produces a substance very similar in appearance to rubber. Such polymers are added to lubricating oils to improve their viscosity index characteristics. When isobutylene is copolymerized with a small quantity of a diolefin, a synthetic rubber is produced which may become more important in the very near future. Styrene itself, which is being manufactured in increasingly large amounts as a constituent for synthetic rubber, is truly a petroleum resin. Both ethylene and benzene, raw materials for styrene, can be produced from petroleum. Styrene is also found in the distillates when low molecular weight hydrocarbons are pyrolyzed.

Resins from petroleum are distinctly an American development. We have a wealth of petroleum and the American chemists and physicists have made good use of this abundance as the starting point for many interesting syntheses—resins from petroleum being one of the many.

The flexibility of Saran tubing, together with its toughness and durability, makes it especially adaptable as a replacement for the rubber tubing formerly used in laboratories.

Saran Pipe and Tubing

DOW CHEMICAL CO.,

Midland, Mich.

TODAY, more than ever before, the eyes of America are looking to plastics for the solution to the stringent metal situation. The chemical industry has accepted the responsibility of producing much-needed products that will replace strategic materials, such as metals and rubber, and release them for the production of essential war goods.

Several plastics are commercially available, each possessing marked characteristics that make it best fitted for specific applications. Outstanding among them is Saran. This product of the Dow Chemical Co. is commercially available as pipe and tubing and in other forms.

Saran pipe is one of the Dow Chemical Co.'s most recent plastic contributions to the victory program. This revolutionary pipe is made of a chemically resistant thermoplastic resin that has proved its practicability in numerous difficult applications to which it has been subjected.

Chemical Resistance of Saran Pipe[a]

(At room temperature)

Reagent	Stability Rating[b]	Reagent	Stability Rating[b]
98% (conc.) H_2SO_4	Good	Carbon tetrachloride	Good
60% H_2SO_4	Excellent	Ethylene dichloride	Poor
10% H_2SO_4	Excellent	Diethyl ether	Poor
35% (conc.) HCl	Excellent	Dioxane	Unsuitable
30% H_2SO_4	Excellent	Benzene	Fair
10% HCl	Excellent	*o*-Dichlorobenzene	Poor
65% (conc.) HNO_3	Excellent	Ethyl gasoline	Excellent
10% HNO_3	Excellent	Turpentine	Excellent

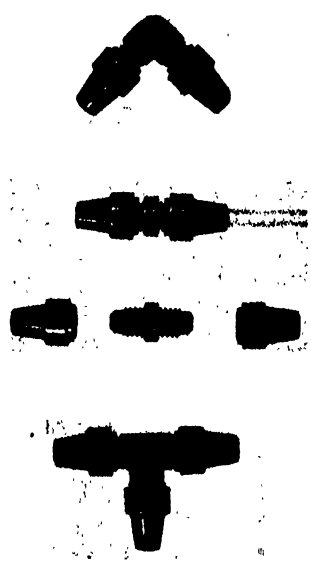
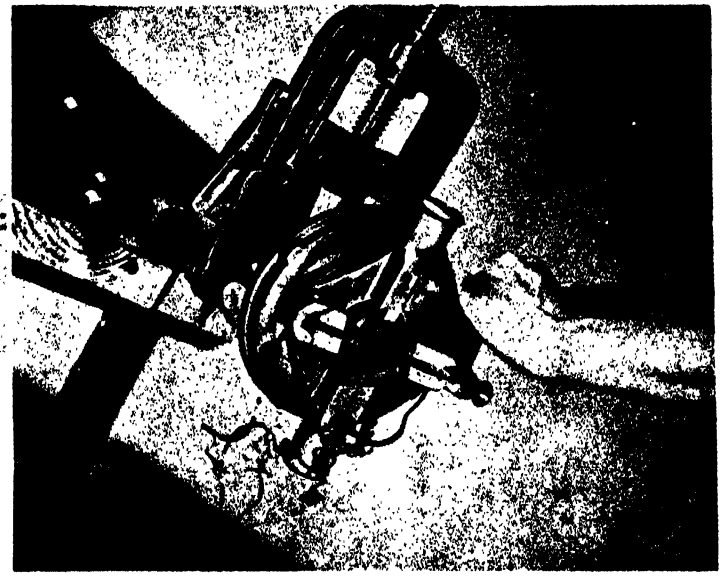
10% Acetic	Excellent	Lubricating oil	Excellent
5% H_2SO_3	Excellent	Linseed oil	Excellent
Conc. oleic	Excellent	Bromine water	Unsuitable
50% NaOH	Fair	Chlorine water	Unsuitable
10% NaOH	Good	Bleaching solution	Excellent
28% NH_3	Unsuitable	10% Duponol	Excellent
10% NH_3	Poor	10% Zinc hydrosulfite	Excellent
Ethyl alcohol	Excellent	15% $CaCl_2$	Excellent
Ethyl acetate	Fair	15% $FeSO_4$	Good
Acetone	Fair	Water	Excellent
Methyl isobutyl ketone	Fair	Air	Excellent

[a] Three months of continuous exposure.

[b] The stability rating given is based upon observed changes in color, weight, dimension, tensile strength, and hardness of the samples tested.





Welding operations with Saran pipe are simple, rapid, and can be accomplished in less than 1 minute. Two lengths of pipe are placed on a hot plate (temperature 350° to 400° F.) and held long enough to form a small inventory of molten material. The bead or molten material inventory is visible at the outside surfaces of the two pieces. Then the two ends are pressed together and allowed to cool for a few seconds. Within 24 hours the welded joint has strength equal to any other portion of the pipe.

Direct heating methods are ideal for welding in the field. Saran pipe lends itself, under adverse conditions, to this method. It can be easily welded with use of a gas flame or torch-heated unit, against which two pieces of pipe are placed. The general rules of hot-plate welding should be observed, and care must be taken not to overheat the material as this will substantially weaken the joint.

In the same field, Dow offers American industry another equally useful plastic innovation—Saran tubing. Here is a tubing that replaces metal piping in homes, industrial plants, and machines that require the piping of gas, air, water, and a wide variety of corrosive liquids.

Above. **In a simplified method for welding Saran pipe in the field gas flame heat is applied to a hot disk. Special care is taken here not to overheat the material.** ***Left.*** **The pipe and tubing application shows both tee and elbow weld. Standard welded fittings may now be easily fabricated with this new Saran pipe.** ***Left below.*** **Injection-molded fittings, made from the same plastic material used in the extrusion of tubing are likewise adaptable to threaded precision parts.** ***Right below.*** **The operation of threading Saran pipe on standard pipe threading equipment is clearly shown. It is easy to handle, but it is suggested that sharp pipe dies be used.**

It was designed principally to play an outstanding role wherever service requirements would be too severe for other materials. Because of its unusual properties, it offers almost unlimited possibilities to chemical processing plants, oil, gas, and water companies, and innumerable general industries.

Saran pipe and tubing are tough, durable, flexible, and nonscaling. Other unique properties are its amazing resistance to the abrasive and corrosive action of soaps, oils, chemicals, and moisture. It resists freezing and is heat-resistant to 170° F. Listed are the results of wide range chemical resistance tests conducted over a three-month exposure period:

Production of Saran pipe by a modified extrusion process assures a smooth, round material with dimensions identical to those of extra strong iron pipe. At present, sizes are $^1/_2$, $^3/_4$, 1 inch, and $1^1/_4$, $1^1/_2$, and 2 inches. Larger sizes are promised in the near future.

Sharp standard pipe dies can be used to thread Saran pipe, an operation which exactly parallels cutting of standard pipe threads on metallic pipe and makes it practical to install Saran pipe with either metallic or Saran fittings.

Standard flanges of Saran are available in sizes from $^1/_2$ inch through 2 inches. These are standard iron pipe companion flanges that conform to present size specifications. Other fittings such as couplings, reducers, nipples, ells, bushings, and plugs, will be available as rapidly as molds can be constructed.

An important factor in shipping, general handling, and suspension is Saran's weight—less than one quarter that of iron.

Some astounding facts about this tough but flexible tubing are that it withstands freezing and continuous heat up to 170° F.,

accommodates high and low pressures, is noncorrosive and nonscaling. Saran tubing, already in use in many commercial installations, is fabricated in a wide range of sizes and wall thicknesses. It can be secured from 1/8 inch to as large as 3/4 inch in diameter with the promise of even larger sizes soon.

Saran is well adapted to the molding of threaded precision parts, and fittings are injection-molded of the same plastic material used so successfully in extruded tubing. It is important that they be tough, durable, and accurate so that they will stand up under extremely difficult applications formerly requiring metal. Saran tubing may be installed with most flare or compression type metal fittings or with special fittings molded of Saran.

The properties of Saran speak for themselves. Saran pipe and tubing give excellent service with a nominal maintenance cost. By using plastic materials, a great saving can often be accomplished by dispensing with so-called necessary production repairs and attendant losses in man-hours and money.

Saran pipe, tubing, and fittings give industry new tools to keep America producing for the war program.

Phenol

DOW CHEMICAL CO., Midland, Mich.

SYNTHETIC PHENOL was first produced in 1924 by the reaction of chlorobenzene and caustic soda at a temperature of 350° to 400° C. and a pressure of 5,000 pounds per square inch. The reaction takes place in a tubular reactor through which the mixture is continually pumped. This reactor was featured in the original Aylsworth patent under which Dow has a license. The Aylsworth process for producing phenol did not succeed because of the accumulation of diphenyl oxide which at that time was a useless chemical by-product. The Dow process, however, is unique in that the diphenyl oxide is returned to the reaction mixture forming an equilibrium mixture. In other words, when diphenyl oxide is returned to the chlorobenzene-caustic soda mixture, no more diphenyl oxide is produced than the original 15 per cent of reaction by-product.

Dow now, of course, finds use for most of its diphenyl oxide in its Dowtherm, the low-pressure, high-temperature, heat-transfer medium, but any that is left over is returned to the phenol process.

There are also two more by-products of the reaction of chlorobenzene with caustic soda. These are *o*-phenyl phenol (sold as Dowicide I, a mildew mold-proofing agent), and *p*-phenyl phenol, which is used in varnish.

Five years ago a new discovery was made at Dow which again revolutionized the process of phenol manufacture by eliminating the external heat formerly necessary to the reaction.

By introducing heat exchange coils whereby the ingoing liquid is heated by the outgoing liquor, it was found that the heat of reaction was sufficient to raise the mixture to the required temperature of 350° to 400° C. without need for any outside heat.

Welding operations with Saran pipe are both simple and rapid and can be accomplished in less than a minute. Shown here is the first step in hot plate welding. Two pieces of Saran pipe are held on a plate that is heated to 350° to 400° F. until a molten material inventory appears.

Soybean Plastics

GEORGE H. BROTHER[1]

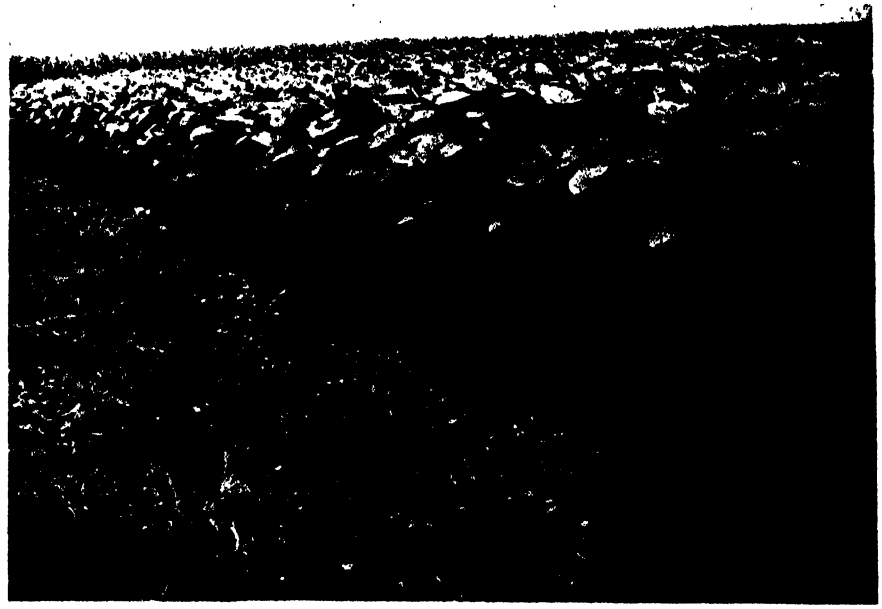
U. S. Regional Soybean Industrial Products Laboratory[2], Bureau of Agricultural Chemistry and Engineering, Agricultural Research Administration
U. S. Department of Agriculture

New candidates in the field of commercial plastics during the past five years have had to meet stiff competition with those already established. The phenolics, for example, are low-cost plastics, strong, water-resistant, and of good electrical properties. The ureas have infinite color possibilities, durability, and ease of fabrication. The cellulose plastics are even better than the ureas in range of color, and of these cellulose acetate is adaptable to injection molding. The methacrylate and polystyrene plastics have optical clarity, insulating properties, and ease of fabrication. All have set high standards, and the newcomer must show real merit in order to find a place among them.

In such a field, in spite of high requirements and standards, soybean plastics have established themselves. In combination with phenolic resins, as will be shown, they produce plastics with a wider color range than the regular phenolic molding plastics. During the present emergency, soybean meal may play an important part as an extender for high-priority phenolic resin.

Soybean plastics belong to the industrial protein group, the principal member of which is casein derived from milk. Protein plastics are characterized by good color possibilities, good strength, and low cost, but also by poor water resistance and by lack of permanence if subjected to moisture. This weakness has restricted casein, the established protein plastic, to the manufacture of buttons and other small decorative objects.

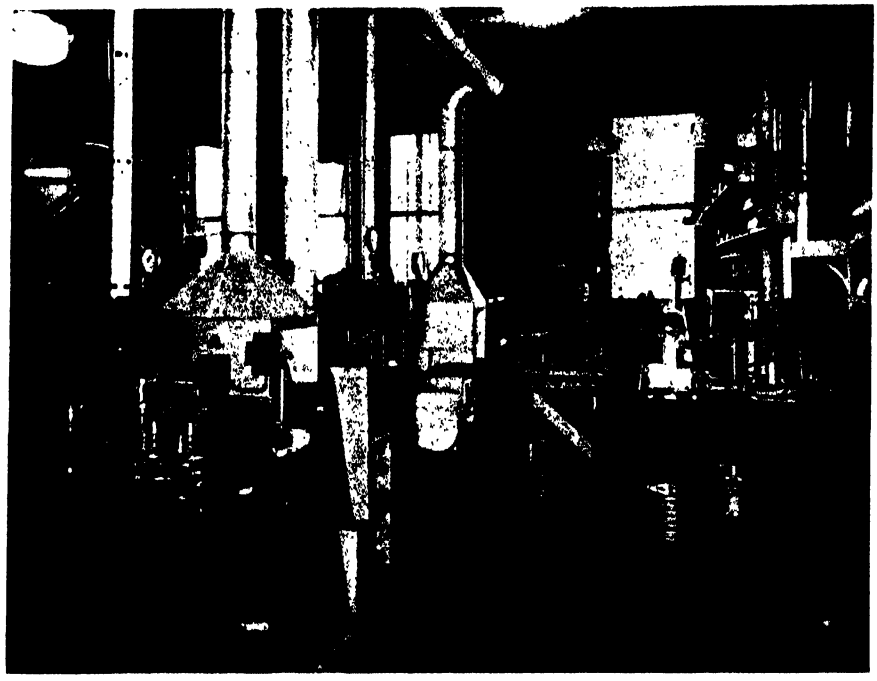
The first serious attempt to develop plastics from soybeans was made by Satow, in Japan, around 1920. His product, prepared by "glutenizing" the soybean protein with aqueous caustic solutions, is so unstable that it fractures spontaneously on drying. The next important development was the much publicized soybean plastic of a prominent American automobile manufacturer. This was a regular phenolic molding compound in which 50 per cent or less of the usual wood flour filler was replaced with soybean meal. The advantages of this product over the regular phenolic molding compound were slightly better plastic flow characteristics and chemurgic implications; the disadvantage was reduced water resistance. Distributor parts, accelerator pedals, and knobs were molded from this plastic on production scale, but not steering wheels, as is popularly believed.



The publicity given to this development proved of considerable value in attracting public attention to the possibilities of soybeans in plastics. In consequence, upon the establishment of the Regional Soybean Industrial Products Laboratory by the United States Department of Agriculture at Urbana, Ill., plastics research was made one of the major projects for investigation.

This investigation opened up two possible lines of application: refinements on the development mentioned above and an entirely new application. In the first place it was found possible to prepare formaldehyde-hardened or tanned soybean protein which is completely thermoplastic. This development is of considerable fundamental importance because previously all protein materials had to be formed to shape in the unhardened condition and then treated with formaldehyde to render them as water resistant and permanent as possible. That process was time-consuming and expensive, and of course made the preparation of a protein molding material impossible. The soybean protein-formaldehyde thermoplastic material is a molding plastic which comes finished from the die.

This material alone does not completely meet the industrial plastics needs, because it is not suitable for injection molding. However, it was found to be perfectly compatible with phenolic resin, with which it formed a new type of plastic material. This material, in comparison with the regular phenolic wood-flour molding plastic, has greater color possibilities (since protein is a good dye base), greater plastic flow, about the same strength, and similar thermosetting characteristics (thus fitting it into the same molding cycle), but with somewhat less water resistance.



More recent developments have shown that it is possible to treat the solvent-extracted soybean meal so that it can be mixed unhardened with the phenol and formaldehyde before the condensation reaction starts. The resulting product shows advantages in properties of plastic flow and water resistance over the earlier mixtures. This treatment consists in leaching out the solubles with water at the pH of the protein (4.0 to 4.6), and then heating the residue to denature the protein and dry it to 3 per cent moisture content or less.

Some mixtures of the foregoing type have been put on the market by several companies, in colors ranging from red to blue. White and light pastel shades are not possible. The shades produced are not so bright as those of urea or cellulose plastics, but they are much better than

Soybeans in range 400 at Agronomy Farm, Illinois Agricultural Experiment Station. In foreground appears a wild soybean selection; in background is a Peking variety.

[1] Present address, Western Regional Research Laboratory, Albany, Calif.
[2] Now combined with the Northern Regional Research Laboratory, Peoria, Ill.

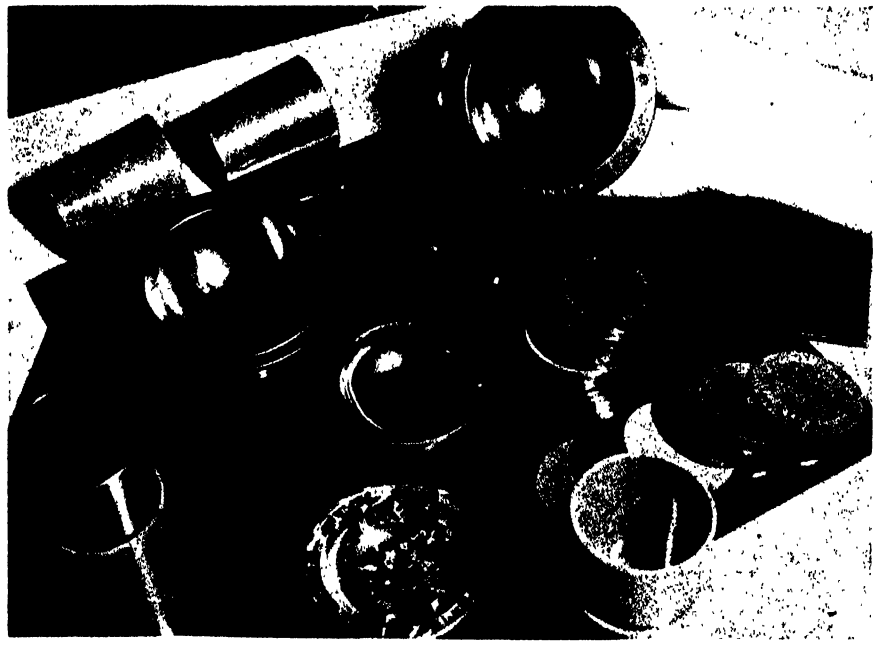
Shown here is the equipment used in making plastics. Beginning at left (clockwise around room): compounding rolls, hydraulic press, mixes, and plastics flow tester.

anything previously produced with phenolics. In the present emergency, with phenolformaldehyde resin among our seriously restricted materials, this soybean meal extender may prove of real assistance.

The other line of plastic development followed at the Soybean Laboratory was the preparation of laminated plastic material from soybean protein. It was found possible to prepare a water solution of soybean protein in formaldehyde, which upon drying is a thermoplastic formaldehyde-hardened protein. Fibrous material, such as sheets of unsized kraft paper, impregnated with this solution and dried, may be stacked between the heated platens of a press and united into a laminated board with sufficient heat and pressure. The board has about the same flexural and impact strengths as phenolic laminated material, but of course less water resistance. However, if single sheets of phenolic impregnated paper are placed on the top and bottom of the stack of soybean-protein-impregnated sheets when they are introduced into the press, the resulting laminated board will have exposed phenolic faces and consequently the water resistance of phenolic plastic, except on the edges. This is not serious, because it is necessary to protect the edges of phenolic laminated board for maximum water resistance.

So far as is known, there has been no application of this soybean laminated material. This might be a good time to extend considerably our limited supply of phenolic resins. The substitution of the formaldehyde-soybean protein for the phenolic resin not only would reduce very considerably the quantity of the latter necessary for laminated material, but the time of the pressing cycle could be shortened by about 20 to 30 minutes for the all-phenolic laminated to about 5 minutes for the soybean protein-phenolic material, thus also speeding production. Little or no change in present equipment would be necessary.

Other emergency applications are possible for soybean protein, such as replacement of casein in part of the button production, as an extender for phenolic resins in plywood adhesives, and the like; but in these uses soybean protein remains inherently a protein, with all its recognized virtues and shortcomings. In the field of industrial protein technology the outstanding need is for better knowledge and application of those fundamental protein characteristics—structural and otherwise—that are primarily responsible for such properties as water absorption, plasticity, etc. With such information available, it is hoped that protein structures and properties may be amenable to modifications that will correct weaknesses and make available an abundance of new material with interesting plastic possibilities. This material might no longer be considered strictly as soybean protein, but it would be derived from soybean meal by economical and practical processes. The hope of large-scale commercial nonfood application of soybean meal lies in the success of this type of investigation.



Army-Navy Production Awards

THE Texas Gulf Sulphur Co. received the Army-Navy E flag for outstanding accomplishments in the production of war materials in a ceremony November 2 at Newgulf, Tex. Brigadier General Ray O. Avery, Commanding Officer, Edgewood Arsenal, and Commandant, Chemical Warfare School, and Rear Admiral P. W. Foote, United States Navy, delivered addresses.

The Clarostat Mfg. Co., Brooklyn, N. Y., received the Army-Navy E on November 13. The company is on a 100 per cent war basis, with many of its products standard equipment in our fighting planes.

The Indium Corp. of America, Utica, N. Y., received the Army-Navy production award on November 12, for excellence in war production.

The Armstrong Cork Co., Lancaster, Penna., is scheduled to receive the award on November 30.

Representative plastic pieces which were molded from soybean phenolic molding powder.

American Chemical Society

Progress Report No. 7 of the Committee on the Professional Training of Chemists

The most recent meeting of the committee, September 4 and 5, 1942, was immediately previous to the Buffalo meeting of the American Chemical Society.

There follows a list of institutions the committee deems to be qualified to offer professional training for chemists:

Agricultural and Mechanical College of Texas, College Station, Tex.
Allegheny College, Meadville, Penna.
Amherst College, Amherst, Mass.
Armour College of Engineering of Illinois Institute of Technology, Chicago, Ill.
Boston College, Chestnut Hill, Mass.
Bowdoin College, Brunswick, Maine.
Brigham Young University, Provo, Utah.
Brown University, Providence, R. I.
Bryn Mawr College, Bryn Mawr, Penna.
Bucknell University, Lewisburg, Penna.
California Institute of Technology, Pasadena, Calif.
Carnegie Institute of Technology, Pittsburgh, Penna.
Case School of Applied Science, Cleveland, Ohio.
Catholic University of America, Washington, D. C.
City College, College of the City of New York, New York, N. Y.
Columbia University, New York, N. Y.
Cornell University, Ithaca, N. Y.
Dartmouth College, Hanover, N. H.
DePauw University, Greencastle, Ind.
Drexel Institute of Technology, Philadelphia, Penna.
Duke University, Durham, N. C.
Emory University, Emory University, Ga.
Fordham University, New York, N. Y.
Harvard University, Cambridge, Mass.
Haverford College, Haverford, Penna.
Howard University, Washington, D. C.
Indiana University, Bloomington, Ind.
Iowa State College, Ames, Iowa.
Johns Hopkins University, Baltimore, Md.
Juniata College, Huntingdon, Penna.
Kansas State College, Manhattan, Kans.
Lafayette College, Easton, Penna.
Lawrence College, Appleton, Wis.
Lehigh University, Bethlehem, Penna.
Louisiana State University, University, La.
Massachusetts Institute of Technology, Cambridge, Mass.
Massachusetts State College, Amherst, Mass.
Miami University, Oxford, Ohio.
Michigan College of Mining and Technology, Houghton, Mich.
Middlebury College, Middlebury, Vt.
Mississippi State College, State College, Miss.
Missouri School of Mines, Rolla, Mo.
Montana State College, Boseman, Mont.
Mount Holyoke College, South Hadley, Mass.
New York University (University Heights and Washington Square College), New York, N. Y.
Newcomb Memorial College, H. Sophie, New Orleans, La.
Northeastern University, Boston, Mass.
Northwestern University, Evanston, Ill.
Oberlin College, Oberlin, Ohio.
Ohio State University, Columbus, Ohio.
Oklahoma Agricultural and Mechanical College, Stillwater, Okla.
Oregon State College, Corvallis, Ore.
Pennsylvania State College, State College, Penna.
Philadelphia College of Pharmacy and Science, Philadelphia, Penna.
Polytechnic Institute of Brooklyn, Brooklyn, N. Y.
Pomona College, Claremont, Calif.
Princeton University, Princeton, N. J.
Purdue University, Lafayette, Ind.
Reed College, Portland, Ore.
Rensselaer Polytechnic Institute, Troy, N. Y.
Rice Institute, Houston, Tex.
St. Louis University, St. Louis, Mo.
Stanford University, Stanford University, Calif.
State College of Washington, Pullman, Wash.
State University of Iowa, Iowa City, Iowa.
Swarthmore College, Swarthmore, Penna.
Syracuse University, Syracuse, N. Y.
Trinity College, Hartford, Conn.
Tufts College, Medford, Mass.
Tulane University, New Orleans, La.
Union College, Schenectady, N. Y.
University of Akron, Akron, Ohio.
University of Arizona, Tucson, Ariz.
University of Arkansas, Fayetteville, Ark.
University of Buffalo, Buffalo, N. Y.
University of California, Berkeley, Calif.
University of California, Los Angeles, Calif.
University of Chicago, Chicago, Ill.
University of Cincinnati, Cincinnati, Ohio.
University of Colorado, Boulder, Colo.
University of Delaware, Newark, Del.
University of Denver, Denver, Colo.
University of Detroit, Detroit, Mich.
University of Florida, Gainesville, Fla.
University of Idaho, Moscow, Idaho.
University of Illinois, Urbana, Ill.
University of Kansas, Lawrence, Kans.
University of Maine, Orono, Maine.
University of Maryland, College Park, Md.
University of Michigan, Ann Arbor, Mich.
University of Minnesota, Minneapolis, Minn.
University of Missouri, Columbia, Mo.
University of Nebraska, Lincoln, Nebr.
University of Nevada, Reno, Nev.
University of New Hampshire, Durham, N. H.
University of North Carolina, Chapel Hill, N. C.
University of Notre Dame, Notre Dame, Ind.
University of Pennsylvania, Philadelphia, Penna.
University of Pittsburgh, Pittsburgh, Penna.
University of Rochester, Rochester, N. Y.
University of the South, Sewanee, Tenn.
University of South Dakota, Vermillion, S. Dak.
University of Southern California, Los Angeles, Calif.
University of Tennessee, Knoxville, Tenn.
University of Texas, Austin, Tex.
University of Utah, Salt Lake City, Utah.
University of Vermont, Burlington, Vt.
University of Virginia, Charlottesville, Va.
University of Washington, Seattle, Wash.
University of Wichita, Wichita, Kans.
University of Wisconsin, Madison, Wis.
Vanderbilt University, Nashville, Tenn.
Vassar College, Poughkeepsie, N. Y.
Villanova College, Villanova, Penna.
Virginia Polytechnic Institute, Blacksburg, Va.
Wabash College, Crawfordsville, Ind.
Washington University, St. Louis, Mo.
Washington and Lee University, Lexington, Va.
Wayne University, Detroit, Mich.
Wesleyan University, Middletown, Conn.
West Virginia University, Morgantown, W. Va.
Western Reserve University, Cleveland, Ohio.
Williams College, Williamstown, Mass.
Worcester Polytechnic Institute, Worcester, Mass.
Yale University, New Haven, Conn.

The Council Policy Committee recommended the following motion to the Council at the Detroit meeting, September 1940, and it was unanimously passed:

Moved, that the American Chemical Society accredit for chemical engineering instruction those institutions as and when accredited by the American Institute of Chemical Engineers.

In accordance with this action, the list of institutions whose chemical engineering curricula are approved by the American Institute of Chemical Engineers as of October 18, 1942, follows:

Bucknell University, Lewisburg, Penna.
California Institute of Technology (five-year course), Pasadena, Calif.
Carnegie Institute of Technology, Pittsburgh, Penna.
Case School of Applied Science, Cleveland, Ohio.
Clarkson College of Technology, Potsdam, N. Y.
Columbia University, New York, N. Y.
Cornell University, Ithaca, N. Y.
Drexel Institute, Philadelphia, Penna.
Georgia School of Technology (including cooperative curriculum), Atlanta, Ga.
Illinois Institute of Technology (Armour College of Engineering), Chicago, Ill.
Iowa State College, Ames, Iowa.
Johns Hopkins University, Baltimore, Md.
Lehigh University, Bethlehem, Penna.
Louisiana State University, University, La.
Massachusetts Institute of Technology, Cambridge, Mass.
New York University (day and seven-year evening), New York, N. Y.
Northeastern University, Boston, Mass.
Ohio State University, Columbus, Ohio.
Oregon State College, Corvallis, Ore.
Pennsylvania State College, State College, Penna.
Polytechnic Institute of Brooklyn (day and eight-year evening), Brooklyn, N. Y.
Princeton University, Princeton, N. J.
Purdue University, Lafayette, Ind.
Rensselaer Polytechnic Institute, Troy, N. Y.
Rice Institute, Houston, Tex.
State University of Iowa, Iowa City, Iowa.
Syracuse University, Syracuse, N. Y.
The Cooper Union School of Engineering (day course and evening course), New York, N. Y.
University of Cincinnati, Cincinnati, Ohio.
University of Delaware, Newark, Del.
University of Detroit, Detroit, Mich.
University of Florida, Gainesville, Fla.
University of Illinois, Urbana, Ill.

University of Louisville, Louisville, Ky.
University of Maryland, College Park, Md.
University of Michigan, Ann Arbor, Mich.
University of Minnesota, Minneapolis, Minn.
University of Missouri, Columbia, Mo.
University of Oklahoma, Norman, Okla.
University of Pennsylvania, Philadelphia, Penna.
University of Pittsburgh, Pittsburgh, Penna.
University of Rochester, Rochester, N. Y.
University of Tennessee, Knoxville, Tenn.
University of Washington, Seattle, Wash.
University of Wisconsin, Madison, Wis.
Virginia Polytechnic Institute, Blacksburg, Va.
Worcester Polytechnic Institute, Worcester, Mass.
Yale University, New Haven, Conn.

June 19, 1942.

Do We Need 10,000,000 Fighters Now?[1]

"THE Army," an observant soldier friend of ours proudly said the other day, "is always totalitarian. It always wants to take everything in sight, simply to be on the safe side."

It begins to look as if the Army has been getting too much—not of everything, but of our available manpower—for us to stay on the safe side as regards winning the war with reasonable speed and efficiency.

There is no argument about the proposition that we ought to arm and train as many men as will be necessary to lick what somebody called our two and one-half enemies—Germany, Japan, and Italy—and that we should not waste time about it.

But how fast do we have to build up the Army of 10,000,000 to 13,000,000 men of which General Lewis B. Hershey of Selective Service talks so copiously? Even more to the point: How fast can we build up this Army and keep our war plants producing the necessary war materials and our farms producing the necessary food for the Army and the rest of us?

We now have an Army of 4,000,000-plus, and a Navy and Air Forces which are growing fast in both personnel and matériel. The draft is hauling men into the Army at a terrific clip, with little regard for the war plants' imperative needs of skilled supervisors and trained workers, or for the farmers' needs of farm labor.

As one result, food rationing is coming on us apace; has already begun with various meats.

As another, more and more war-plant managements are complaining that they cannot keep skilled workers and supervisors because of the draft boards' indiscriminate and, in some cases, arrogant demands.

"Recently, for instance," says President Harvey N. Davis of the Stevens Institute of Technology, "a small company working overtime on parts and accessories for fighting airplanes lost its assistant production manager to the draft. When last heard from, he was a private building barracks at a cantonment.

Plainly, the only winners in this transaction were Hirohito, Hitler, and Mussolini.

In our anxiety to build up a huge fighting force almost overnight, we seem to be losing sight of the fact that this force must be backed by millions of producers of fighting gear of all kinds, and by millions of farmers capable of feeding the fighters and the civilian population, plus the beneficiaries of our Lend-Lease food shipments to other lands.

Lopsided development of this three-ply war machine is bound to have dangerous effects. Keep it up long enough and let it go far enough, and those effects can be fatal to our hopes of winning the war. Britain found that out earlier in the war. Britain drafted more men than the home front, with the best will in the world, could equip or feed. Presently, Britain found itself forced to return a lot of soldiers to industry and the farms.

At this writing, we are on the way toward finding ourselves some day with a gigantic Army that (1) has no place to go (2) has not enough ships to go in, (3) is short on vital war supplies and equipment, and (4) is getting hungry while civilians get hungrier.

Chairman Paul V. McNutt of the Manpower Allocation Board had better be given more power; the draft boards' indiscriminate zeal had better be curbed somehow; and both of these things had better be done in a hurry. As things look to us, there is no time to lose in putting into practice the principle recently laid down by Secretary of War Stimson himself:

The Army is greatly in need of men of specialized training, particularly in physics, chemistry, engineering, and medicine. We are equally interested in having adequate numbers of men of such training available to war-production industries and civilian-research agencies of the Government.

In short, the home front needs help, and the home front can't wait much longer for that help.

Who Makes It?

THE following chemicals are wanted by The National Registry of Rare Chemicals, Armour Research Foundation, 35 West 33rd St., Chicago, Ill.: sodium hyposulfate, esculin, glyoxylic acid, *N*-vinylphthalimide, adonitol, phosphoglyceric aldehyde, glycolic aldehyde, hydroxypyruvic acid, glycerophosphate, and quinic acid.

Mechanical Smoker Gets the Once-Over

Harry N. Holmes (*right*), President of the ACS, who recently addressed the Virginia Section of the SOCIETY at the University of Richmond, goes over the mechanical smoker of the American Tobacco Co.'s research laboratories with W. C. Jones, chief chemist, Virginia Department of Agriculture and president-elect, Virginia Academy of Science.

The Chemical Bakers—Ross Allen and Philip Schaffner

This sketch in the series of father-son articles on well-known chemists might equally well be called a "son-grandson" contribution, for the father in the pair is himself the son of a distinguished teacher of chemistry. **Ross Allen Baker** was born in Greencastle, Ind., November 1886, to Luemma Allen and Philip Schaffner Baker, who for 25 years was professor of chemistry at DePauw University. Originally minded to become a famous violinist, he apparently realized by his junior year the bald fact that the flowing locks necessary for such a career were not to be his much longer, so he took his A.B. in chemistry from DePauw in 1906 and the M.A. a year later, became head of the chemistry department at Baker University, and in 1910 went on to the University of Wisconsin, receiving his doctorate in 1914. With these degrees went membership in Phi Beta Kappa, Sigma Xi, and Alpha Chi Sigma, as well as about all the scholastic honors open to a student in his field. World War I found him an assistant professor at the University of Minnesota, but left him a Major in the Chemical Warfare Service. When, in October 1918 the writer of this article, as a mere "shavetail" in the CWS, had the privilege of demonstrating a new-type gas mask to Major Baker, dynamic commandant of the U. S. Gas School at Camp Kendrick, N. J., neither lieutenant nor major had any idea that a few more months would see them beginning a 10-year association in the teaching of freshman chemists at Syracuse University. In 1930 Dr. Baker went to the City College of New York, where he is now professor of chemistry in charge of the Divisional Department in the School of Business and Civic Administration.

An attempt to set down even a part of the bewildering number of Dr. Baker's interests, activities, and accomplishments within the limitations of a few hundred words should fall in the same class with trying to engrave the Declaration of Independence on the head of a pin. Fortunately, he is so well known to all A. C. S. members that we need make only passing mention of his constant and continuing services to the Society in all capacities from chairman of a Local Section through Division Chairman (Chemical Education) to national Councilor and Chairman of the Board of Publications of the Division of Chemical Education. For the rest, an imposing list of memberships in learned and professional societies, civic organizations, and the like must be merely suggested by quoting two of his guiding principles: "Never too busy", and "Try anything once". The willing horse has been handed a load of chairmanships, managerial duties, presidencies, and trusteeships that only one of spring-steel constitution further toughened by varsity athletics and a lifelong interest in all outdoor sports could expect to carry. Possibly he found the antidote to so much administrative and desk work in helping to train three Eagle Scouts out of a family of five husky sons (only 20 per cent of whom, he reports with admirable scientific accuracy, seem destined to follow him in his profession. At this writing three of the five are in the service). In his teaching, the "try-anything-once" principle has been applied with two of his numerous hobbies—devising ingenious new apparatus and glass blowing—to make his clear-cut lectures still clearer with simple but striking demonstrations; but most appreciated by the students is his willingness to answer their questions by dropping other business and making the test to settle the matter there and then. Next in order of appreciation would probably come his abundant patience and irrepressible sense of humor.

Our subject was once described as "one of the most effective positive catalysts known, a compound of barium, potassium, and erbium, of formula BaKEr"; and while opinions may differ as to the exact make-up of the agent, all who know him are in complete agreement that his addition to any group results in an immediate acceleration of the thought processes and physical activities of everybody concerned. Accomplished musician, able raconteur, inveterate punster, and hair-trigger analyst of situations, he goes into action at the drop of a remark, and thereafter things keep moving. And that, with new acquaintances and old friends alike, will always be their outstanding impression of Ross Baker—where he is, things keep moving.

Louis C. Jordy, *Captain, ASC*

Philip Schaffner Baker was born in Minneapolis, Minn., November 30, 1916. After a forced march of nearly two years in the wake of the Chemical Warfare Service, he found himself in the shadow of Syracuse University where he lived for the next 11 years. During this period "The Bakery", as he calls his family, began a series of auto and bicycle trips which have taken him and his four brothers into every state of the Union and through several foreign countries. These experiences gave Phil his love of travel which eventuated in his learning to fly.

Phil took his first year of college chemistry at Occidental and his next two years at Antioch, where his "co-op" assignment was in the laboratories of the Dow Chemical Co. His chemistry major was completed at DePauw University. After obtaining the M.A. at the University of Arkansas, he entered the University of Illinois, where he is now a graduate assistant and a candidate for the Ph.D. He has spent the past three summers as a research assistant at the Institute of Paper Chemistry.

When Phil graduated from the Baldwin, N. Y., high school he was already an Eagle Scout, a member of the Hi Y and of the National Honor Society. Four seasons in an Adirondack woodcraft camp had made him proficient in most land and water sports. From both sides of his family he inherited a love of music; he plays the violin and sings in the choir. His hobbies include tennis, golf, ping-pong, sailing, and glass blowing.

Phil is an energetic worker, has a sunny disposition, and enjoys the respect of all who know him—even the victims of his practical jokes. He has been a student member of the American Chemical Society since 1936 and is a member of the American Association for the Advancement of Science, Sigma Xi and Phi Lambda Upsilon. He is now serving a second year as steward of the Illinois Chapter of Alpha Chi Sigma. In planning for the future Phil hopes to be teaching chemistry some day. In this he will be following the tradition which began with his maternal great grandfather, Charles G. Downey, who held the first chair of chemistry at DePauw University just 100 years ago; was continued by his

grandfather, Philip Schaffner Baker, professor of chemistry at DePauw and the Medical College of Indiana until 1901, and is being carried on by his father.

ROBERT S. VORIS

Hawley Products Fellowship in Mellon Institute

HAWLEY PRODUCTS CO., St. Charles, Ill., manufacturer of molded cellulosic and allied plastic products, has founded an Industrial Fellowship in Mellon Institute, Pittsburgh, for the purpose of conducting an investigational program of importance to our armed forces.

J. C. Williams, a specialist in cellulose chemistry and plastics technology, has been appointed to the incumbency of this fellowship. He will be assisted by Peter Shanta, a chemical engineer from the University of Pittsburgh, and will have the constant cooperative aid of experts in the institute and in the donor's organization.

Teaching Fellowships Available at New York University

SEVERAL teaching fellowships are available, beginning in February 1943 in the Chemistry Department of the Washington Square College of Arts and Science, New York University. Applicants must have a recent bachelor's degree and be ready to begin work toward the doctorate in the Graduate School. The duties include 16 hours of laboratory instruction per week and the paper grading connected therewith. The stipend for two semesters is $700 and three full courses of graduate work. Application forms may be secured from Professor W. C. MacTavish, Washington Square College of Arts and Science, Washington Square, New York, N. Y.

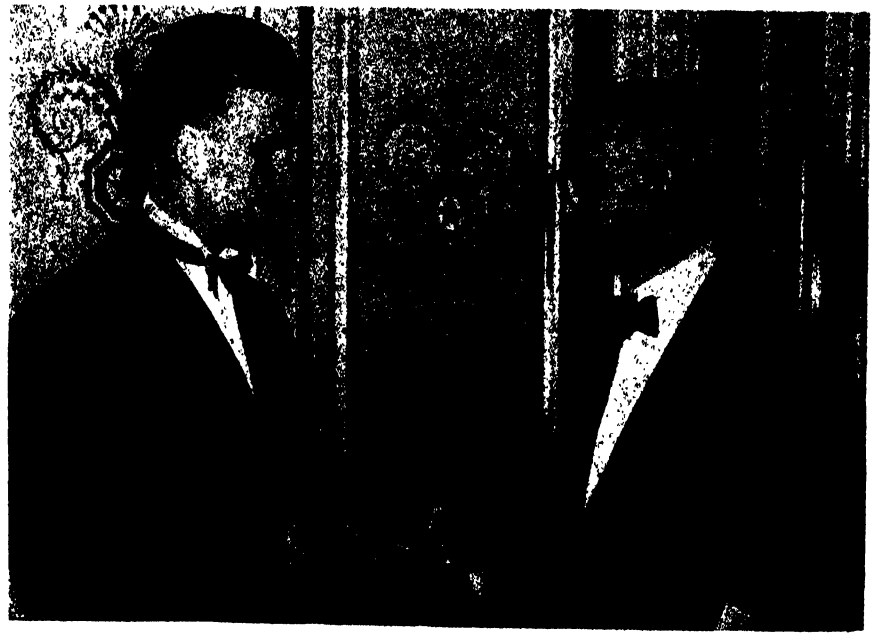
Training in X-Ray Technique

AT THE request of the Government and under the auspices of the Engineering, Science, and Management War Training Program, the University of Illinois will give a short course, which will be repeated as many times as necessary, on the techniques and applications of x-ray testing methods, including radiography, microradiography, and x-ray diffraction. This is for the benefit of war industries and government laboratories which have had to develop x-ray methods in the emergency and in many cases with technical employees who have not had specialized training.

The course will last for one week, full time. No charge will be made for the course. It is open to anyone who is actually engaged in x-ray testing or is about to begin this work for any industry or laboratory. Those interested should apply at once to G. L. Clark, 315 Noyes Chemical Laboratory, University of Illinois, Urbana, Ill. Each session is limited to 10 persons, and the first course is planned for early in December.

Rubber Relief

ANOTHER candidate for the job of our former standby, rubber, has been announced. This time it is ethyl cellulose compounded with oil and chemical plasticizers in the range of 40 to 60 per cent ethyl cellulose and 60 to 40 per cent plasticizer. The result is "Ethyl Rubber" in forms which are tough, pliable, flexible, and thermoplastic. They can be made without solvent and have been found stable to many conditions of exposure in preliminary tests conducted by the manufacturer, the Hercules Powder Co., Wilmington, Del. Data collected on a few of the many soft, rubberlike ethyl cellulose compositions possible indicated that the better ones are comparable to white rubber (as used in rubber gloves and similar articles) in stability in water. They also showed greatly improved abrasion resistance over rubber samples (both white and black as used in inner tubes), although the "bounce" of natural rubber could not be equaled. Tensile strength in one case was found to be nine times greater than for rubber, though elongation of the better formulations was only one fifth to one fourth that of rubber. At −78° C. the ethyl compositions could be considered comparable to rubber in flexibility, although at −20° C. white rubber showed far greater flexibility. However, several of the synthetic formulations possessed this valuable property in high degree.



The new "rubber" can be formulated to show superior properties in connection with exposure to gasoline, motor oil, and butter, and in its resistance to oxidation by ozone.

It has been shown that formulation plays an important part in determining the quality of ethyl rubber, but even before there is time to perfect and thoroughly test formulas, it is likely that many uses will be found for this welcome addition to the growing family of man-made elastomers.

John Wesley Hyatt Award to D. S. Frederick

THE first annual John Wesley Hyatt Award, for an outstanding contribution in 1941 to the plastics industry, was conferred on Donald S. Frederick of Röhm & Haas Co., in New York, October 30. Dr. Frederick was honored for his work in adapting transparent, colorless acrylic plastics to the needs of American military aircraft. Plexiglas, the methyl methacrylate plastic used in the development work of Dr. Frederick and associates, forms cockpit enclosures, gun turrets, broad windows, domes, and other key parts as well as bomber noses.

The award, established by the Hercules Powder Co. last year, was named for John Wesley Hyatt, who is credited with having been the inventor in 1867 of the first plastic, a mixture of nitrocellulose and camphor, out of which came the present-day celluloid. In winning this award, Dr. Frederick received the Hyatt Gold Medal, designed by Paul Manship, and one thousand dollars.

Donald S. Frederick receives the John Wesley Hyatt Award for outstanding contribution to the plastics industry in 1941 from Lyman J. Briggs, Director, National Bureau of Standards, at the presentation dinner held at Hotel Waldorf-Astoria in New York on October 30.

POTOMAC POSTSCRIPTS

WPB Activities

Drums. New steel drum containers and parts in the hands of manufacturers have been put under complete allocation control by the Director General for Operations in order that delivery of the drums may be channeled to supply the most essential requirements of the production program. Sheet steel allotted for the manufacture of steel drums has been found insufficient to satisfy all outstanding orders rated AA-1 or higher, making it necessary to exercise tighter control over sale and delivery of the containers. The order, M-255, prohibits manufacturers from selling or delivering new steel drums and parts (excepting flanges, plugs, and cap seals) after November 16 without specific authorization of the Director General for Operations. Likewise persons manufacturing drums for their own use are prohibited from using any drums which were not completely manufactured before November 16 unless they have similar authorization. Authorization must be applied for by addressing a letter in duplicate to the Containers Branch, War Production Board, Washington, D. C., marked Ref.: M-255. The letter should have a copy of the purchase order attached and should state what the drums are to be used for, what products are to be shipped in them, where they are to be shipped, and the use to which their contents are to be put.

Glycerol. Domestic production of glycerol will be increased 6,000,000 to 7,000,000 pounds per year by Order M-193, effective December 1, 1942, which sets up certain standards of production efficiency in glycerol recovery for the soap, fat splitting, and glycerol refining industries. Production standards are now in effect on coconut oil (M-60) and palm oil (M-59), though the standards now announced on glycerol are more severe than either of these two.

In order to obtain permission to saponify or hydrolyze any fat or oil in a process in which glycerol is produced, the producer must not permit more than 1 per cent of glycerol to remain in the finished product, and must recover 92 per cent of the glycerol product of the spent lyes. In the case of fat splitting, not less than 94 per cent shall be recovered. An exception is the manufacture of liquid, potash, cold-made, and half-boiled soap, where not more than 2.75 per cent glycerol may remain in the product. A producer covered by this exemption may use in any quarter not more than 90 per cent of his average quarterly consumption in the two-year period ending December 31, 1941. Refiners of crude glycerol are required to recover not less than 96 per cent of the glycerol content.

Because of certain technical conditions, exceptions to this order are made for persons consuming less than 10,000 pounds of fats, oil, or fatty acids per month, because they represent a small part of the industry and because compliance would be technologically difficult.

Magnesium. To continue control over the country's magnesium supply, the magnesium order, M-2-b, has been extended until December 31, 1942, by an amendment issued by the Director General for Operations. Originally, it was to have expired on October 31, 1942.

Molybdenum. Permission to deliver small amounts of molybdenum without applying for an allocation under Order M-110 was formalized today by Supplementary Order M-110-a. Under certain conditions, deliveries up to 500 pounds of contained molybdenum may be made in any one month without applying for an allocation. Melters, other than large producers of iron and steel products, may use up to 500 pounds monthly without submitting melting schedules to WPB.

Phenol. Allocation of phenol has been extended to include certain substituted phenols and phenol-bearing materials by General Preference Order M-27, as amended November 3. The amended order provides that after December 1, 1942, no person may sell, deliver, accept delivery of, or use any of the materials covered by the order unless he has specific authorization by WPB to do so. Until December 1, 1942, the present order will operate.

Chemicals brought under control of the amended order include: tar acid oil (any coal tar distillate containing 5 per cent or more of phenols), carbolates (any aqueous solution of an alkali metal sale containing 10 per cent or more of phenols), phenols (including phenol, cresols, and xylenols), their homologs and mixtures, *p*-phenyl-phenol, *o*-phenyl-phenol, butyl phenol, amyl phenol, and *bis*-phenol.

The standard chemical allocation forms PD-600 and PD-601, which may be obtained at WPB field offices, are to be used in applying for authorization under this order.

Reagent Chemicals. Research laboratories have been given assistance to secure a continuing supply of reagent chemicals, laboratory equipment, and other materials by the revision of existing Preference Rating Order P-43 and the issuance of a new Preference Rating Order, P-135, by the Director General for Operations. Order P-43, as revised, is expanded to cover qualified production control as well as research laboratories, and assigns to all laboratories holding a serial number under P-43, a rating of AA-2X for the purchase of equipment, reagent chemicals, and other materials. For material costing more than $50, except reagent chemicals, specific authorization by the WPB is required to apply the rating. Such authorization is to be applied for on Form PD-620, and all holders of serial numbers must file Form PD-93 by the 15th of each month. The order also assigns a rating of AA-4 to deliveries of laboratory equipment to a laboratory not assigned a serial number. Deliveries under this provision must be authorized by WPB.

Order P-135 enables laboratories not holding serial numbers under P-43 to use a rating of AA-2X for chemicals used for analytical, testing, control, educational, or research purposes. Laboratories, other than those specifically approved under P-43, may use this rating to buy from supply houses, to purchase from manufacturers, and manufacturers to buy raw materials for the production of reagent chemicals.

The rating assigned by P-135 may be applied without prior granting of a serial number as under P-43.

Resins. Phenolic resins and phenolic resin molding compounds will be put under complete allocation and use control, effective December 1, 1942, by General Preference Order M-246, issued by the Director General for Operations. The new order, barring delivery or use of phenolic resins or phenolic resin molding compounds without specific authorization by WPB, will guarantee that the output of the phenolic materials industry will be channeled into essential needs. Certain exceptions to these restrictions are made, including orders under 55 gallons per month.

Because the number of vital end-products made from these materials is so great, it is not practicable to restrict rigidly in advance all end-products in which these resins may be used. Therefore, persons seeking resins and compounds for use in certain end-products (such as plywood, protective coatings, laminates, molded products, and the items on List A of the order) are required to file certificates with their suppliers specifying end-use in considerable detail. This will enable the producer to indicate to WPB the end-use of the product for which he seeks phenolic materials, and enable WPB to allocate so that the most essential needs will be met. The standard chemical allocation forms, PD-600 and PD-601 are to be used in applying for authorization to sell, deliver, accept delivery of, and use.

Rubbing Alcohol. The unrestricted sale of rubbing alcohol and rubbing alcohol compounds has been forbidden by Amendment 2 to General Preference Order M-30, issued by the Director General for Operations. The amendment forbids the delivery of any ethyl alcohol or any compound containing it for use as rubbing alcohol except to licensed physicians, dentists, and veterinarians; holders of written doctor's prescription or orders; wholesalers, retailers, and manufacturers for resale in accordance with the terms of this order; and to certain Government agencies.

Sodium Sulfate. Inventory restrictions on sodium sulfate (salt cake) are removed by Amendment 7 to General Inventory Order M-161, issued by the Director General for Operations. This order was set up for the purpose of providing necessary exemptions to inventory restrictions and contains a list of such commodities so exempted.

Terneplate and Tinplate. Use of terneplate containers after November 30 for packing varnish removers, liquid lacquers, lacquer thinners, lacquer stains, and shellac has been prohibited by the Director General for Operations. After November 30 containers for these products will be made of substitute materials such as glass or fibers. Amendment 5 to Order M-81 also provides that terneplate used for packing these products this year cannot exceed 90 per cent of the 1940 consumption. In addition, the amendment prohibits packing of edible liquid oils in tinplate or terneplate containers of less than 5-gallon capacity. For November and December the quota for terneplate and tinplate for such containers is established at 10 per cent of the total 1940 consumption for smaller containers of 5-gallon and higher capacity.

Thermoplastics. Effective date of scheduling production and delivery under the thermoplastics order, M-154, has been postponed from November 1 to January 1 by Amendment 4, issued by the Director General for Operations. The order, which controls the delivery and use of thermoplastics, will continue to operate as in the past. The scheduling provision, requiring producers of raw material to schedule their deliveries, has not yet been made operative. Extension of effective date is for the purpose of providing time to set up scheduling procedures.

Price Regulations

Cadmium. Maximum prices at which the Metals Reserve Company, government procurement agency, may buy idle or frozen stocks of cadmium for its war stock pile have been established by the Office of Price Administration, f. o. b. plant of the Udylite Corp., Detroit, Mich.

Metals Reserve Company has appointed Udylite Corp. as its agent to assist in its cadmium stockpiling and allocation program.

Ferro-Alloys. Dollars-and-cents maximum prices for chrome ores, designed to stabilize ore costs for producers of ferrochromium, chromium chemicals, and chrome refractory products, have been announced by the OPA.

These ceiling prices are provided in Maximum Price Regulation 258 (Chrome Ores), effective November 9, 1942.

Furfural is freed from price control to the extent sold or delivered for use in the manufacture of synthetic rubber, the OPA has announced. The exception is that granted earlier to other ingredients of synthetic rubber, and is contained in the action taken in Amendment 37 to Supplementary Regulation 1, effective October 29.

Vegetable Waxes. The OPA has set specific dollars-and-cents ceilings for imported vegetable waxes, produced mainly in Brazil and northern Mexico, and for domestic and imported beeswax. The new ceilings, effective November 13, hold quotations for most of the important types sold in the United States at levels prevailing in October 1941 and are contained in Maximum Price Regulation 264. (Industrial Waxes). They apply to importers, shippers, and all other sellers.

Controlled Materials Plan Announced by WPB

A LONG-RANGE plan for controlling the flow of critical materials into war production, the Controlled Materials Plan, has been announced by Donald M. Nelson, chairman of the WPB. Evolved from existing distribution systems and from experience gained through their operation, the CMP has the approval of all governmental agencies participating in it. It was drafted after lengthy conferences with the Army, Navy, Maritime Commission, and Office of Civilian Supply, as well as representative consumers and producers of materials, who contributed many suggestions incorporated in the final version.

The main purpose of the plan is to make certain that production schedules are adjusted within material supply so that production requirements are met. This will be accomplished by adjusting requirements for critical materials to the supply and making the quantity and type of materials needed available at the time required to meet approved programs. Allotments of critical materials will be made through seven claimant agencies, such as Army, Navy, Office of Civilian Supply, etc., to prime contractors producing essential goods. Prime contractors, in turn, will divide the allotments with their subcontractors and suppliers.

Carbon and alloy steel, copper, and aluminum are the first controlled materials to be allotted directly under the plan, which becomes effective in its transitory stage in the second quarter of 1943, and will be in full operation by July 1.

This method of distributing materials is, in effect, "vertical allotment". So far as controlled materials are concerned, it will gradually replace the present priority system, including the Production Requirements Plan, which is on a horizontal basis. Under PRP each firm, large or small, prime contractor or subcontractor, submits his own requirements to WPB for approval, and receives an individual authorization to obtain materials. Under the new CMP, prime contractors will prepare and submit a breakdown of all materials required for the approved end-products on which they are working. The breakdown will comprise a bill of materials, specifying not only what materials are required, but when they must be received to carry out the authorized program. In making up his bill of materials, each prime contractor will include both the materials he puts into production himself and those needed by his subcontractors and their suppliers. The bill of materials will cover requirements not only for controlled materials but also for other scarce materials listed in the outline of the plan.

WPB Industry Branches to Be Strengthened

REORGANIZATION of industry branches of the WPB, giving them greater strength, is being undertaken by the Office of Program Determination under the direction of Ferdinand Eberstadt, vice chairman of WPB, and Ernest Kanzler, director general for operations. One of the major reasons for strengthening branches is to enable them to handle the additional burdens to be placed on them by the new controlled materials plan, announced November 2.

To as great an extent as possible, each industry branch will follow a similar pattern. Many of the functions of the Office of the Director General for Operations, not including the Bureau of Priorities Control, will be decentralized and assigned to branches, making them responsible for all operating phases such as the execution of programs, policies, and procedures established for the resources assigned to branches. Branches will not, however, be

responsible for policy, planning, coordination, and supervision phases. Permanent connection with industry will be maintained through active industry advisory committees assigned to each branch. Claimant agencies (Army, Navy, Maritime Commission, Office of Civilian Supply, Lend-Lease, etc.) will assign permanent representatives to each branch. Permanent connection with labor also will be maintained through representatives assigned to each branch. The pattern will apply to all material, product, facility, or industry branches, although the detailed composition will depend on the individual branch.

Foreign Patent Applications Made Available

DRAWINGS and specifications of foreign-owned patent applications seized by his office will be printed and made available to American industry at a nominal price, Leo T. Crowley, Alien Property Custodian, has announced. These applications ordinarily cover latest developments in patentable fields.

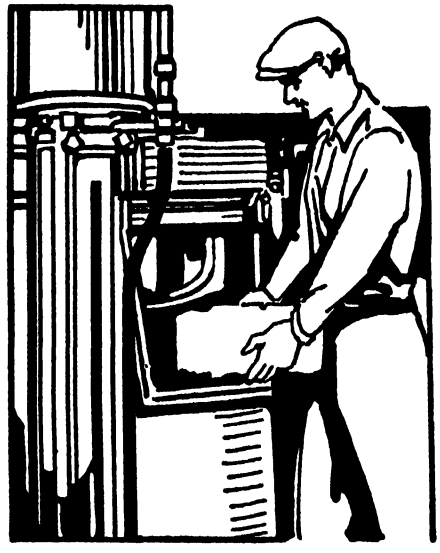
Publication of the printed copies of patent applications will begin during December. Applications will be listed as they are printed, in classified order, in the *Official Gazette of the United States Patent Office.* Announcement of the cost of copies and of the method of purchase will be made in the same publication.

Meanwhile the Alien Property Custodian will make the information contained in the files of these applications available, in so far as is practical, to any person residing in the United States having a genuine legitimate interest therein. Any registered patent attorney may obtain permission to inspect and make copies of the file of a vested application (other than an application which stands under secrecy order) upon filing with the Patent Prosecution Section, Office of the Alien Property Custodian, Washington, D. C., a request upon a form which will be furnished upon request by the Custodian's Washington, Chicago, or New York offices.

Office of Production Research and Development, WPB

AN OFFICE OF PRODUCTION RESEARCH AND DEVELOPMENT has been set up within the War Production Board, and Harvey N. Davis, president of the Stevens Institute of Technology, has been named its director. The office will parallel in the production field the work being done in regard to instruments of war by the Office of Scientific Research and Development, and was set up after consultation with Vannevar Bush, head of that agency. Except for contracts connected with the rubber program, which will be handled by William N. Jeffers, the new agency will make all WPB contracts for research and development work to be done by other governmental agencies, colleges, and universities, commercial laboratories, and corporations.

Its four principal functions are:



1. To provide technical information on problems with which Mr. Nelson is directly concerned and on research and development work now in progress in WPB, and to provide WPB divisions and branches with research information and findings on work which they have in progress.
2. To initiate evaluation of specific scientific or technological proposals through the establishment of expert committees or reference to existing research groups.
3. To get needed research accomplished, by contracting with outside laboratories or agencies for experimental work.
4. To bring about development of projects or processes that merit it, through contracting for the construction of prototypes or the erection of pilot plants.

Dr. Davis will serve as technical adviser to Mr. Nelson on engineering and scientific matters.

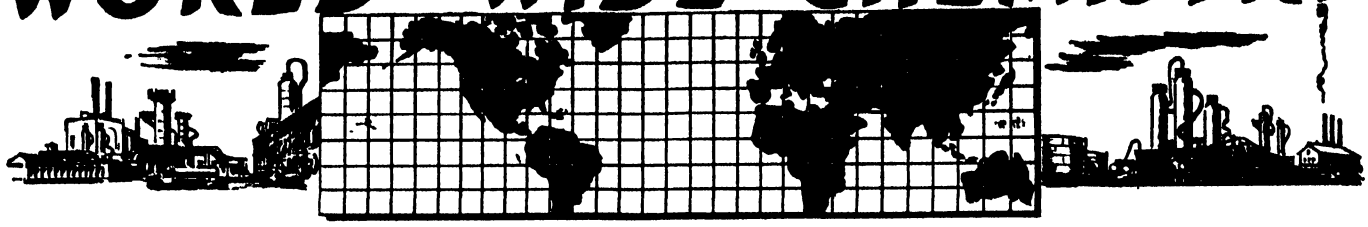
Commodity Credit Corporation to Purchase Rotenone

A GOVERNMENT program for the purchase and importation of rotenone from Brazil and Peru to be carried out by Commodity Credit Corporation has been announced jointly by the U. S. Department of Agriculture and the Board of Economic Warfare. Officials hope to import at least 4,500,000 pounds of the insecticide during the next 12 months to help make up for the reduction in imports resulting from Japanese invasion of Singapore and to facilitate increased truck crop and livestock production.

Under the plan, the CCC is the exclusive purchaser of all rotenone-bearing roots having a rotenone content of not less than 3 per cent. Purchases will be made through existing commercial companies acting as agents for the CCC, so as not to disturb normal business channels. Sales of stocks acquired under the program will be made upon approval of the WPB at prices not in excess of those established by the OPA.

Containers Industry Assists WPB

SEVERAL technical committees have been organized in the containers industry to assist in the development of substitutes for tin, steel, and other critical materials used in the industry, William W. Fitzhugh, deputy chief of WPB's Containers Branch, has announced. The committees, set up voluntarily by the industry, have offered their assistance to the Containers Branch in solving difficult problems surrounding the development and use of substitute materials. The branch has asked packers to submit their problems together with a description of what efforts have been made to develop substitutes, and data will be forwarded to the proper committee with a request for practical assistance in perfecting a substitute container.



Industrial Alcohol Program Gains Momentum

THE American Distilling Co., aided by the engineering staff of WPB's Chemical Branch, will save the Government more than $20,000 per month on the cost of alcohol furnished to war production. With great pressure put on distilleries for increasing output, a combination of increased volume and technical achievements has made it possible for this company to drop its price to the Government from the OPA ceiling price of 50 cents per gallon to 46 and 47 cents per gallon, John Boyer, chief of WPB's Alcohol Section has announced. At the present time all beverage distilleries which can make industrial alcohol are doing so. Those which cannot are making high wines for further conversion to alcohol. Conversion of beverage distilleries is part of a program undertaken by the Alcohol Section of WPB's Chemical Branch to provide the alcohol needed for production of smokeless powder, synthetic rubber, and other vital war products.

CROSS-HAULING must be eliminated voluntarily from the nonmetallic minerals industry in order to avoid serious impairments of supply through inadequate transportation facilities, R. J. Lund, chief of the Miscellaneous Minerals Branch of WPB, told a recent meeting of the Nonmetallic Minerals Transportation Industry Advisory Committee.

At this first meeting of the newly formed committee, industry members said that opportunities existed for them to conserve transportation facilities, though certain problems would require considerable study.

WORLD-WIDE CHEMISTRY

Since 1934 the planting of tung trees in the State of São Paulo has increased sharply and production of seeds averages from 15 to 35 kg., although specially selected trees furnish up to 50 kg. per year. It is expected that during the current year about 200,000 trees will give 1,600 metric tons of nuts from which about 200 metric tons of oil will be obtained. It is also estimated that with the increase in the producing trees the amount of oil obtained in 1944 will be 600 metric tons and in 1946 about 1,200 metric tons.

More than 300 metric tons of tung oil nuts were obtained during the past year in the State of Paraná, and the seeds were sent to mills in São Paulo for the production of tung oil. Assuming that production of tung seeds in Paraná will be greatly increased in the coming years, construction of two mills is planned. Prices for tung seeds and oils correspond to 7 and 90 cents per kg., respectively.

American Concerns Propose Nickel and Aluminum Production

The American Smelting and Refining Co. recently presented a proposal to the federal government for the exploitation of the nickel deposits located at São José do Tocantins in the State of Goiás. The reserves of these deposits were estimated to be more than 10,000,000 metric tons with a nickel content as high as 5 per cent. Disadvantages in exploiting these mines are lack of fuel and difficulties in transportation because they are located 300 km. from the terminal of the Goiás Railway.

The Reynolds Metal Co., interested in aluminum production, sent three technicians to Brazil to study the feasibility of installing one or more plants for production of aluminum from the bauxite ore deposits located in Minas Geraes and São Paulo. Transport facilities and electric power are easily obtained on a large scale. It was revealed that a plant for the production of aluminum by the Bayer process has been in operation several months in the city of Ouro Preto under the control of the Cia. Eletro Química de Minas Geraes. The capital for the installation of the plant was loaned by the Bank of Brazil.

Ramie Cultivation Shows Interesting Results

The Ministry of Agriculture recently released information concerning the 1941 crop of ramie (*Bohemeria nivea*). More than 3,000 hectares of ramie were planted. Three metric tons of pure fiber, corresponding to 6 tons of ramie with bark, are obtained from each four hectares planted. One kilogram of the fiber with the bark sells in São Paulo for 5 to 6.5 mil reis (about 25 to 32.50 U. S. cents). This gives the farmer a net profit of about three times the amount invested in the cultivation of the fiber.

Gasogene Increase Expected to Relieve Gasoline Imports

On account of the difficulty in transporting gasoline to Brazil, the federal government is taking steps to stimulate the use of gas producer vehicles in trucks, lorries, busses, and, in a minor scale, passenger cars. According to figures recently released by the Comissão Nacional do Gasogenio, about 3,500 vehicles are equipped with gas generators. In order to guarantee to the manufacturers of gas producers the necessary material for their production, the federal government through the National Committee placed orders in the United States for 500 metric tons of steel black sheets. Power was given to the Metallurgy Committee, created some months ago, to establish priorities for the purchase and sale of metallic materials useful for national defense and the safety of Brazil. All importers and resellers were forced to declare the stocks of metallic materials appropriate for the construction of gas producers and no commercial transaction involving such materials will be permitted without the previous approval of the Metallurgy Committee. Such transactions are confined not only to new, but to used materials. The São Paulo State Government is intensifying the use of gas generator apparatus and expects that by the end of the current year more than 4,000 gasogene vehicles will be running in the State of São Paulo alone.

American-Brazilian Treaties Are Controlled by Commission

Following the return of the Brazilian Minister of Finance from a trip to the United States and Canada where several treaties were signed, the federal government created a commission for the control of those treaties. More recently a technical committee was nominated, headed by Minister João Alberto, former Brazilian Ambassador to Canada, to study, with the United States Industrial Mission to Brazil, the possibilities of installing new industries which would use Brazilian resources as raw materials. The United States Industrial Mission will suggest, whenever convenient, the transfer of American industrial equipment and material from factories now out of operation in the United States. Several industrial problems are being studied by the American Mission in collaboration with the technical local committees.

An agreement for the purchase of 200,000 metric tons of castor seeds or its equivalent in oil per year by the United States has recently been signed by the Brazilian and American Governments. Prices and conditions for this sale were also fixed. The United States Government will supply the necessary maritime transportation facilities, and if total quantity bought cannot be shipped it, will warehouse the unshipped balance at its own risk and account.

Exports and Export Regulations Decreed

Several decrees were recently signed by the President of Brazil regulating the export of Brazilian products. Classification and standardization of tobacco leaf grown in Bafa were approved in August. Specifications and tables for the classification and fiscal control of essential oils produced from citrus fruits were approved in July.

EDITOR'S NOTE. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

Rubber and rubber products destined for the United States must be accompanied by a certificate of approval.

Exports of iron ore during 1941 amounted to 420,756 metric tons destined for Great Britain, the United States, and Canada. These countries received the 255,548 metric tons exported during 1940, with the United States occupying first place. In 1940 Great Britain remained as the sole market for iron ore in Europe. During 1939 Brazilian exports of iron ore, amounting to 396,938 metric tons, went to eight countries in Europe and only two on the American Continent, with approximately 75 per cent of the total going to Germany and Dansig.

Exports of pine from Brazil during the first five months of the current year totaled 154,370 metric tons, an increase of 37,095 metric tons over the same period in 1941. Shipments of pine made in May 1942 represented 29.3 per cent of total export value during that month, with Argentina and Uruguay as the best purchasers. Owing to transport difficulties, exports to South Africa decreased during the first five months of 1942 in comparison with the same period of last year. Total Brazilian exports to the Union of South Africa amounted to 33,368 metric tons against 22,492 in 1940 and only 12,727 in 1939. Pine wood, coffee, cotton textiles, carbaúba and licurí waxes, cocoa butter, preserved meat, and cotton yarns constituted the principal products exported by Brazil to the Union of South Africa during 1941.

Advanced Notices on Chemical Meetings

The Fourth South American Chemical Congress, which was to be held January 5 to 12, 1943, has been postponed again on account of transportation difficulties, the Executive Committee reports. No definite date for the meeting has been set.

In January 1943 the Associação Química do Brasil will hold its annual meeting in the City of Curitiba, the capital of the State of Paraná. At that time the Council of the Brazilian Chemical Society will count the votes for the vice president of the society and the present viee president will become president.

Caixa Postal 970
Rio de Janeiro
October 30, 1942

Soap imports into Haiti during the eight months ended May 1942 amounted to 1,319,300 kg. valued at 917,500 gourdes, according to a report to the Commerce Department. Receipts of perfumeries and toiletries during these months were valued at 345,300 gourdes.

In May of the current year soap imports were valued at 75,000 and perfumery and toiletries at 8,000 gourdes.

Continental Europe

The German low-temperature carbonization industry has undergone expansion during the war. Low-temperature carbonization plants require comparatively small amounts of essential metals, can be erected much more rapidly than hydrogenation works, and yield large quantities of valuable products to take the place of other materials which are now scarce. Low-temperature carbonization coke did not meet with great interest on the part of potential consumers in the early days when qualities were not always satisfactory, but it is reported that prejudice is being overcome, and this coke is used for many new purposes. It may be burnt on the fire-grate in the place of gas coal, is suitable as a gas producer fuel, and is used in the manufacture of water gas. It also replaces ordinary coke in the production of ferro-silicon. Grades of low-temperature carbonization coke with low ash contents are also being used for making calcium carbide, and small-grained material is added to coke and gas coals to improve the resulting coke.

Recently experiments have been carried out with low-temperature carbonization coke as a fuel for mobile gas producers, but the main outlet is still as a fuel for household fire-grates and steam boilers. Though more expensive than coal, it is reputedly more effective and cleaner. Low-temperature carbonization gasoline and gas are used as a motor fuel for road vehicles but require further treatment before they can be used, either by purification in the case of gasoline or by moderate concentration in the case of gases. The low-temperature carbonization gas may be used for blending with water gas and ordinary town gas if there is no opportunity for chemical treatment in the vicinity of the carbonization plant.

Low-Temperature Carbonization Tar Is Produced from Lignite in Germany

Most important among the low-temperature carbonization products is tar. Different qualities are produced, varying according to the process used. Low-temperature carbonization tar fills a very important gap in the production of phenols for which a new process has been developed, but more interest is paid now to the possibility of using the tar for the manufacture of motor fuels and fuel oil for the navy.

Very substantial quantities of low-temperature carbonization tar have been produced for a number of years from lignite in central Germany, and the principal outlet of lignite tar still seems to be hydrogenation works. Lignite low-temperature carbonization tar is treated by the catalytic high-pressure hydrogenation process of I. G. Farbenindustrie A.-G. at temperatures of 450° or 350° C. and yields, apart from motor fuel, colorless paraffin wax, lubricating oils, and Diesel fuels. Another process used on a limited scale only involves cracking the lignite tar under pressures of about 5 atmospheres and more, which yields about 60 per cent of cracking oils in addition to 11 per cent of gas and 25 per cent of cracking pitch. The oils consist of about one third of cracking gasoline Good Diesel fuels may be obtained by cracking lignite tar under pressures of 1 to 3 atmospheres. Use of selective solvents has been tried out in a large experimental plant, and several more plants of similar dimensions are said to be under construction. There are several possible processes for the use of selective solvents. They supply substantial quantities of a good Diesel fuel and of fuel oil, but one of these processes which uses phenol yields gasoline, Diesel fuel (after further cracking), fuel oil, asphalt, and coke for electrodes. More important than these different processes is distillation, which is carried out in various ways. One distillation process yields 5.5 per cent of gasoline, 27 of Diesel fuel, 25 of paraffin oil, 10 of fuel oil, 10 of paraffin wax, 2.5 of coke, and 10 per cent of gas. Other lignite low-temperature carbonization tars, however, may yield different amounts of these products.

Coal Assumes Importance as Source of Low-Temperature Carbonization Tar

Whereas low-temperature carbonization tar from lignite has been used for hydrogenation and other chemical processes for many years, it is only now that the treatment of low-temperature carbonization tar from coal is assuming industrial importance. It is claimed that the experimental phase has been concluded and that no fundamental problems remain unsolved. The authorities have, therefore, ordered the installation of big plants for the treatment of coal low-temperature carbonization tar. There are various ways of treating the material. Hydrogenation of tar carbonized with circulating gases is said to be possible but has not attained any quantitative significance. Treatment with selective solvents supposedly yields as good Diesel oil, paraffin wax, and fuel oil as are obtained from lignite tar but requires preparatory distillation. Cracking, on the other hand, is not considered to be feasible unless carried out in a hydrogen atmosphere at low pressure. The precipitation of the coal tar with benzene, propane, or butane with a view to the removal of asphalt and phenol has been proposed and may yield satisfactory results. The distillation of low-temperature carbonization coal tar, how-

ever, still seems to be in an experimental stage and is said to yield inadequate quantities of fuel oil. It may prove useful in connection with hydrogenation. Although carbonization tar and other products of low-temperature carbonization of lignite or coal are especially valuable to Germany, certain raw materials used in production are scarce. German low-temperature carbonization plants must get along with nonbaking wet coal, and since the treatment of low-temperature carbonization tar has so far been tried out only experimentally, considerable delays will probably occur when the results are put into industrial practice.

Heavy Road Vehicles Converted to Producer Gas

The Generator Staff, the central authority responsible for the conversion of road vehicles to producer gas, has assembled a register of all heavy lorries and tractors to be called up for conversion with a time limit of 90 days, and subsidies varying between 600 and 1,000 marks will be paid for the conversion. All solid fuels suitable for use in producer gas plants are bought centrally by the Generatorkraft company which is the sole distributor. The supply of gas producer fuels, however, is not sufficiently large to provide for all vehicles, and omnibuses, tractors, and certain lorries will be converted to the use of compressed town gas as a fuel if a source of supply is available within 3 km. of the normal radius of the vehicle. Low-pressure town gas will be used as a fuel for omnibuses if at all possible. The central office decides which fuel must be used for any particular gas producer vehicle, and the conversion is omitted only in special cases for constructional reasons.

Committee Studies Use of Coal Dust Motor

Manufacturers of coal dust motors, aided by Reich and party organizations, have formed a committee to investigate the possibilities of the coal dust engine, and special stress has been laid on the early development of commercially useful designs.

Process for Manufacture of Potash Proves Successful

A new process for the manufacture of potassium carbonate has been used by Salzbergwerk Neustassfurt, a subsidiary of Kali-Chemie A.-G., for several years. Among the advantages claimed are comparatively small apparatus, continuity of operations owing to the speedy course of chemical reactions, good output quantities, and small cost of energy. Raw materials used are potassium sulfate, lime, and coke. The process may be divided into two parts, the former of which results in the production of potassium formiate. Potassium sulfate and milk of lime are treated in autoclaves at temperatures above 200° C., and at high pressures with gas containing 30 to 32 per cent carbon monoxide produced from coke, so that a concentrated solution of potassium formiate is obtained. Calcium sulfate is produced as a by-product, and by selection of suitable operating conditions the inclination of calcium sulfate to bind potassium is overcome. Small quantities of potassium sulfate and soluble calcium salts still present in the formiate lye are removed by precipitation with potassium carbonate and evaporation. The second part consists of a calcination process. The primary product is potassium oxalate, and the final product is 99.5 per cent K_2CO_3. The oxygen required for the oxidation of the formiate is supplied by the surplus combustion air.

New Glass Wool Company Is Formed

The Faser-Industrie G. m. b. H. has been formed with a capital of 100,000 marks at Coburg by Glasfabrik Wernerhütte, a company which has been interested in the manufacture of glass wool through another subsidiary. It is reported that the new company is to undertake production of glass wool in other European countries.

Vegetable Oils Replaced in Paint

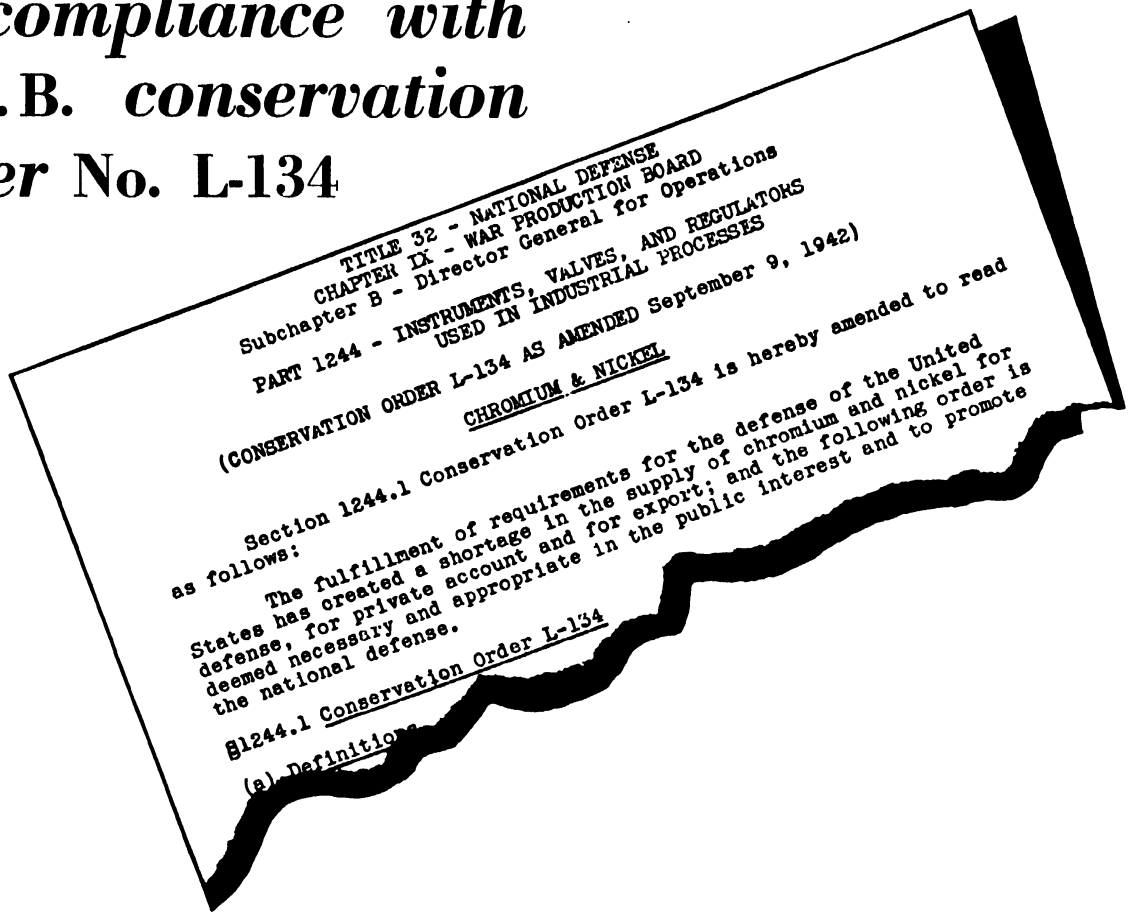
Linseed, rapeseed, and other vegetable oils used in the paint industry are being partly replaced by high viscous products obtained by a new process of combining with halides of fatty acids and consequent treatment with alkali. Unsaturated fatty acids, their glycerides, or other esters (or saponifiable derivatives or mixtures of these which consist mainly of unsaturated fatty acids or their esters) are saturated with chlorine or bromine. The reaction products are then heated with alkali in the presence of little water to 150° to 250° C. The free acids are separated and the reaction products converted into salts or esters. Hardened whale oil, technical oil acid, waste from the purification of sulfur olive oil, and other low-grade materials are reported used for the production and improvement of lacquers, leather, artificial leather, textiles, and synthetic resins.

Plastic Materials for Resin-Lacquered Food Cans

Synthetic resins have been used in Germany for a long time for the protection of food cans against corrosion, and although the results have not always been entirely satisfactory owing to the necessity of using resin-lacquered steel sheets for all purposes, the merits of different resin materials have been determined. The most important condensation lacquers are provided by resins obtained from phenyl-aldehyde condensates, especially those soluble in benzene hydrocarbons. These give a film of great elasticity and adhesive power. Plastified resols, alkyd-phenol resins, modified phenol resins, and resins from the condensates of polybasic acids and polyvalent alcohols and urea-formaldehyde condensation resins are also being used. Among polymerizates, coumaron resins are of little importance, but vinyl polymerizates are used on a large scale. Chlorinated polyvinyl chloride gives good films, although they are somewhat sensitive to temperature changes. Vinyl ether polymerizates, acrylic acid ester resins, styrol polymerizates and polyamides are also being used. In order to increase the adhesive power of the lacquer a short preparatory treatment of the iron surface with an aqueous phosphate solution is recommended.

Alsatian Potash Industry Increases Capital

Elsässische Kaliwerke G. m. b. H., Mulhouse, the company formed in 1941 by the state-owned Preussische Bergwerks- und Hütten-Gesellschaft to operate the potash mines taken over from French owners, has now increased its capital from 50,000 marks to 15,000,000 marks.



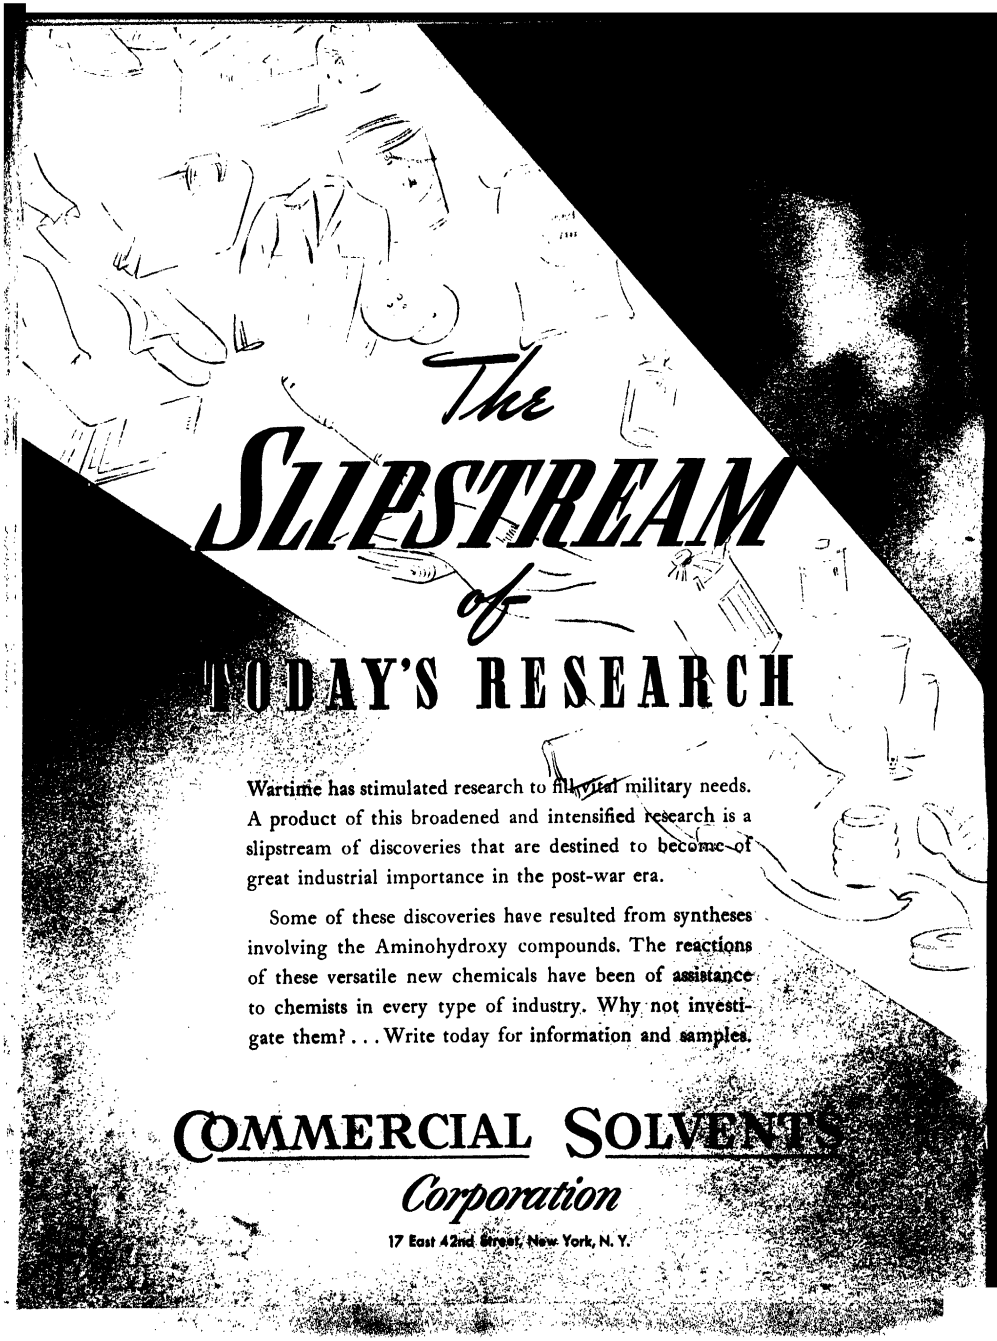
New Institutes Formed at Munich and Franzensbad

An Institute for Artificial Fiber Research has been opened at the Technical College of Munich. Necessary funds are being provided by Süddeutsche Zellwolle A.-G., Kelheim, one of the leading producers of staple fiber. A Mud Research Institute has been set up by the association of German spas at Franzensbad, Czechoslovakia. The institute is to act as a central organization for investigations, advice, and control.

India Plans Increased Production of Quinine

A POLICY of encouraging cinchona cultivation in India to attain self-sufficiency in quinine was urged at a recent meeting between chemical and drug manufacturers and a representative of the Indian Government, according to reports received by the Department of Commerce. It is believed that quinine requirements for the next several years can be met with a larger Bengal production, prudent use of available stocks, and cooperation of middlemen.

How to CONSERVE . . .
ESSENTIAL INSTRUMENT MATERIALS
in compliance with W.P.B. *conservation order* No. L-134



TITLE 32 - NATIONAL DEFENSE
CHAPTER IX - WAR PRODUCTION BOARD
Subchapter B - Director General for Operations
PART 1244 - INSTRUMENTS, VALVES, AND REGULATORS USED IN INDUSTRIAL PROCESSES
(CONSERVATION ORDER L-134 AS AMENDED September 9, 1942)
CHROMIUM & NICKEL
Section 1244.1 Conservation Order L-134 is hereby amended to read as follows:
The fulfillment of requirements for the defense of the United States has created a shortage in the supply of chromium and nickel for defense, for private account and for export; and the following order is deemed necessary and appropriate in the public interest and to promote the national defense.
§1244.1 Conservation Order L-134
(a) Definitions.

Many valuable solutions to problems arising from the new WPB Conservation Order L-134, which drastically limits the use of various materials for thermocouples, lead wire, thermometer bulbs, protecting tubes, etc., are given in the recently published Wheelco Supplement to Thermocouple Bulletin S2-3. The Supplement S2-3 is the result of an extensive analysis of the WPB Order L-134 by Wheelco Engineers and is published for the benefit of those who will be affected by this order. The Supplement also contains a partial summary of the L-134 Order; the complete L-134 Order as amended September 9, 1942, additions and revisions applying to various items in the Wheelco S2-3 Bulletin and a complete list of Wheelco Sales and Service Engineers who can help you with your instrument problems.

Write for your FREE copy of Supplement to Bulletin S2-3 and the issue of Wheelco Comments which deals with Thermocouple construction and maintenance. Also request copy of Bulletin S2-3 if you do not have a copy.

Wheelco Instruments Co.

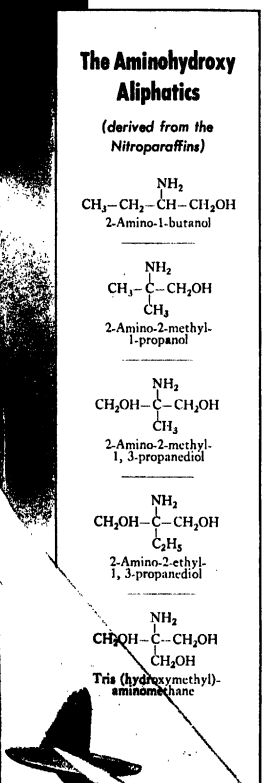
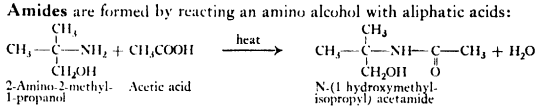
The SLIPSTREAM of TODAY'S RESEARCH



Wartime has stimulated research to fill vital military needs. A product of this broadened and intensified research is a slipstream of discoveries that are destined to become of great industrial importance in the post-war era.

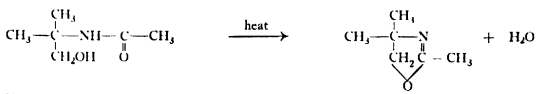
Some of these discoveries have resulted from syntheses involving the Aminohydroxy compounds. The reactions of these versatile new chemicals have been of assistance to chemists in every type of industry. Why not investigate them? . . . Write today for information and samples.

COMMERCIAL SOLVENTS
Corporation
17 East 42nd Street, New York, N. Y.



The Aminohydroxy Aliphatics

(derived from the Nitroparaffins)

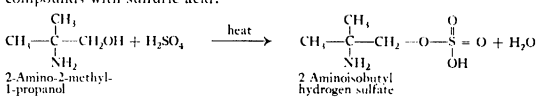


VERSATILITY of the Aminohydroxy Compounds is indicated by these *Typical Reactions:*

Amides are formed by reacting an amino alcohol with aliphatic acids:

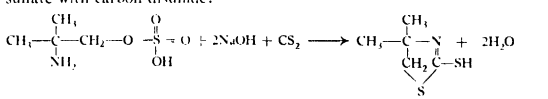
2-Amino-2-methyl-1-propanol — Acetic acid — N-(1 hydroxymethyl-isopropyl) acetamide

Substituted Oxazolines are derived from the aliphatic or fatty acid amides:



N (1-hydroxymethyl-isopropyl) acetamide — 2, 4, 4-Trimethyl-2-oxazoline

Substituted Oxazolidines are made by condensing aminohydroxy compounds with aldehydes:



2-Amino-2-methyl-1-propanol — Acetaldehyde — 2, 4, 4-Trimethyl-oxazolidine

Aminoalkyl Hydrogen Sulfates are obtained on treating aminohydroxy compounds with sulfuric acid:

2-Amino-2-methyl-1-propanol — 2 Aminoisobutyl hydrogen sulfate

Mercapto Thiazolines are made by condensing aminoalkyl hydrogen sulfate with carbon disulfide:

2-Aminoisobutyl hydrogen sulfate — 2-Mercapto-4, 4-dimethyl-2-thiazoline

The Nitroparaffins at Work will be featured in our exhibit at the National Chemical Exposition in Chicago, November 24th to 29th. You are cordially invited to visit our Booth.

Chemists are finding many helpful suggestions in the Data Book, "The Nitroparaffins—New Worlds for Chemical Exploration." A copy will gladly be mailed you on request.

The latest list is printed on page 1239 of the October 10 issue.

Metal Mine War Conference Program

STIMULATION of production of critical metals for the war effort and means of overcoming increasing labor shortages in the mines were subjected to thorough consideration of metal mine operators when they gathered at a two-day war conference sponsored by the Western Division, American Mining Congress, at Salt Lake City, Utah, on November 16 and 17. Sessions were highlighted by addresses by Major General Lewis B. Hershey of the Selective Service System and Brigadier General Frank J. McSherry, operations director of the War Manpower Commission, on the all-important topic of "Manpower for the Mines".

SHARPLES IN THE WAR

Now it can't be told!

We had a great story to tell . . . and one of which we were very proud. But it has been silenced for the duration.

This story concerned Sharples' part in the preparation of a perfected blood plasma, the modern miracle that is saving and will save thousands of lives on America's fighting fronts.

This achievement represents Sharples research in the many war industries that are served today by the most advanced application of centrifugal force available.

Pure Mercury

OTTO H. MÜLLER

Cornell University Medical College, New York, N. Y.

IN A recent article on this subject (*1*), E. Wichers, of the National Bureau of Standards, has pointed out that the condition of the surface of mercury is a sensitive measure of chemical purity. The presence of base metals in a concentration of 1 part in 1,000,000 is indicated by either the formation of a film or "tailing" of the mercury when it is shaken in a glass flask after having been dried. The following procedure, of equal simplicity and based on the same principles, might be used instead of, or in conjunction with, the above. It serves to indicate the degree of progress during the purification of the mercury. The writer learned of this test in the laboratory of J. Heyrovsky in Prague but is not sure that it originated there.

Many may be surprised to learn that pure mercury shaken with distilled water forms a fairly stable foam which disappears gradually in from 5 to 15 seconds. In contrast to this, very "dirty" mercury does not foam at all. Mercury which contains mere traces of impurities does foam when shaken with water, but the foam is stable for 1 or 2 seconds only and then collapses suddenly. Experiments performed in this laboratory have shown that the sensitivity of the foam test is of the same order as the procedure described by E. Wichers (*1*). For instance, an amalgam of 1 mg. of copper in 1 kg. of mercury will fail to give a stable foam when shaken with distilled water. It should be pointed out that the distilled water must not contain any organic material and that the flasks used must be scrupulously clean. A strip of litmus paper dipped for a few seconds into the water to determine its acidity will contaminate it sufficiently to prevent a stable foam with pure mercury. Whenever impurities are present, a film is clearly visible on the surface of the mercury. While pure mercury in contact with water has a mirror-like surface, prolonged shaking usually produces a slight film, probably on account of the presence of carbonate.

The foam test has proved of value in the following procedure for purifying mercury for polarographic studies. The used mercury is first shaken with water in a heavy-walled separatory funnel. [If the mercury is very "dirty", air is sucked through the separatory funnel as described by E. Wichers (*1*)]. The lowest, cleanest portion of the mercury is then allowed to fall through the ungreased stopcock in a fine stream of small drops into a heavy-walled flask or separatory funnel partially filled with a solution of nitric acid and mercurous nitrate. Next, the mercury is shaken with the acid for several minutes and drained through a separatory funnel, again in a fine stream of small drops, into a flask partially filled with distilled water. If some acid has come along with the mercury, a second washing with distilled water is necessary before a stable foam results when the mercury and water are shaken together. If no stable foam appears, further purification with nitric acid is indicated. The scum retained in the funnel after each separation is collected in a special flask for further treatment.

The mercury which produces a good foam with water is poured through a pinhole in a cone of filter paper and can be completely squeezed through this pinhole without leaving any residue on the paper. Such mercury, when dry, satisfies the purity test described by E. Wichers (*1*), and can be used directly for "pool" mercury anodes in polarography. Before the mercury is used for the dropping mercury electrode, however, it is usually purified further by vacuum distillation to remove any noble metals which might lower the very high hydrogen overvoltage observed on pure mercury.

Drawback Provisions of 1942 Revenue Act

THE drawback provisions of the 1942 Revenue Act relate to "distilled spirits" generally (whisky, brandy, rum, gin, etc.) and not "alcohol" exclusively. Such drawback privilege was conferred by an amendment to Section 3250 of the Internal Revenue Code relating to special taxes. This does not give the Bureau of Internal Revenue much power to regulate business conducted by the new class of manufacturers of the products mentioned in the new subdivision L of this section. Any manufacturer can pay the new special tax and, if he is able to procure the taxpaid distilled spirits, will be entitled to the drawback of $3.75 per proof gallon. Had the privilege been restricted to "alcohol" and conferred by an amendment of subchapter C of the code relating to "industrial alcohol", there would be abundant authority to regulate the manufacturers who could obtain the drawback and their business.

Sulfur Trends in September

ALTHOUGH production of sulfur in September 1942 declined 1 per cent from the preceding month, the output in the first nine months of 1942 was 21 per cent greater than in the corresponding period of 1941, according to a statement released by the Bureau of Mines, U. S. Department of the Interior. Mine shipments of sulfur decreased 11 per cent in September compared with August. Producers' stocks were increased 1 per cent during September.

Flash of Genius

IF YOU still have space to devote to the "Flash of Genius" (*1*) discussion, I think your readers will be interested in the following extract from page 491 of the "Report of the Commissioner of Patents for the Year 1849".

Errors Entertained Respecting Inventors

IT IS a prevalent opinion that both ordinary and extraordinary inventions cost their authors little labor and thought to develop: nothing is more erroneous. It is an essential element of man's being and of the constitution of things under which he exists that all truths, mechanical or philosophical, can only be realised by strenuous and continued effort. Our perceptive faculties are too obtuse, and happily for us it is so, to apprehend them at a glance. In that case, they would be held too cheap to be looked for and deemed worthless when seen. If inventions required no exertion to discover, where would be their value? If virtue cost nothing, it would cease to be virtue. No fact is clearer than that man's destinies are in his own hands and that he alone can exalt and debase them. To rouse him to be faithful to himself is Nature's ceaseless care. With powers dormant in him and equal to every exigence, she leaves him to exert them or not. She does naught for him that he can do for himself and has taken care that he shall know nothing, have nothing, that he does not strive for.

It is common to hear ingenious men disparaged by ascribing their best things to lucky or random suggestions—whereas, though appearing fortuitous, they may always be traced to previous reasonings or reflections: sprouting seeds whose transient plantings had been little noticed and forgotten. They had never sprung up had they not fallen on soils prepared by previous culture to receive them. Sparks set not sand on fire, nor do fruitful ideas germinate in barren minds. Flashes of thought, like those of the electric fluid, may dart suddenly and unexpectedly, but they are not less the regular effects of inducing causes. Inspiration descends not in its highest or its lowest forms, but on those who seek to be inspired.

It is not given to man to perfect aught without toil, and seldom without long-continued toil. The smith forges not a ploughshare with a blow, nor is any new device, however simple, matured save by repercussions of thought. "Nul bien sans peine" is a universal truth.

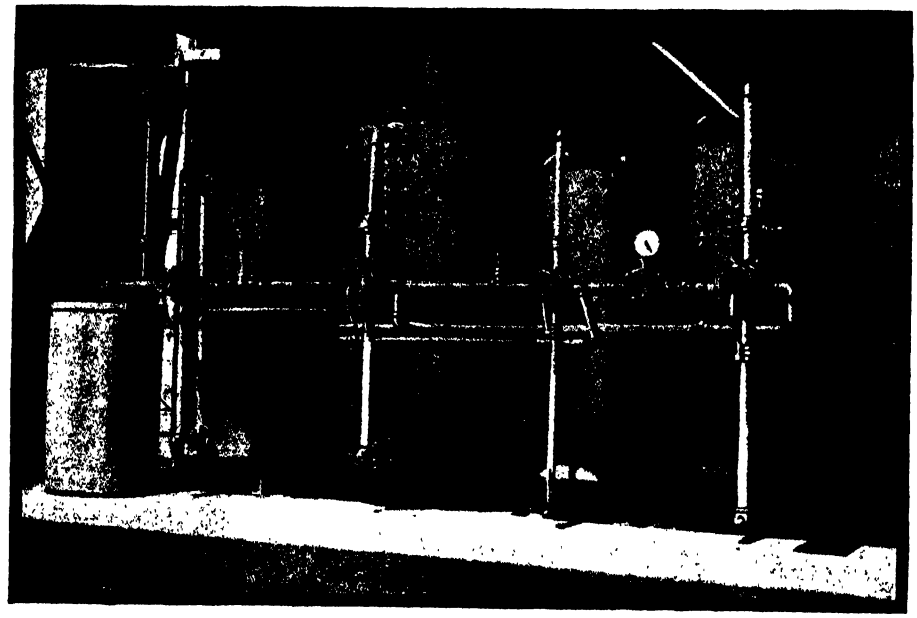
NEW CHEMICAL METHOD

OF DE-IONIZING WATER

REPLACES DISTILLED WATER AT A FRACTION OF THE COST

IN WAR PLANTS today, Illco-Way units are providing de-ionized water for improving *quality*, increasing *output*, and *cutting costs*. Until the development of de-ionizing equipment, the use of purified water was in many cases impractical due to high original and operating costs of distilling equipment.

De-ionized water produced by Illco-Way units contains from two to ten parts per million of dissolved solids, which is comparable to single-distilled water and which meets the requirements for almost all chemical or industrial purposes. Illco-Way units assure *reproducibility* of your laboratory results in factory operation, regardless of the quality of your water supply. The water produced is *uniform* at all times.



This modern, economical method replaces distilled water in *aircraft factories, synthetic rubber plants, pharmaceutical houses, mirror and ceramic plants, distilleries, process industries.* Write today for details regarding Illco-Way applications in *your* plant! Find out how Illco-Way equipment can speed production and help cut costs!

1000 GALLONS FOR LESS THAN A DOLLAR! On the average water supply, the cost of the water is less than a dollar per thousand gallons — *including depreciation and maintenance!* And when the supply is low in dissolved solids, the cost may be considerably less — even as low as 20,000 gallons for one dollar.

HIGH FLOW RATES Where large quantities of pure water must be supplied in a short space of time, the high flow rates of the Illco-Way units are particularly advantageous. The smallest unit has a permissible flow of 100 gallons an hour, with the output of larger units increasing up to 50,000 gallons per hour.

AUTOMATIC Operation is completely automatic until capacity is reached, when unit is regenerated in much the same way as a water softener. A conductivity meter indicates the purity of the treated water. Units will not lime up because *no heat is used.*

SMALL FLOOR SPACE The Illco-Way unit is compact. A unit delivering 300 gallons per hour occupies a space roughly 4 feet by 8 feet, and a unit delivering an uninterrupted flow of 30,000 gallons per hour occupies a floor space approximately 11 feet by 70 feet.

Typical Illco-Way unit installed in an aircraft factory. Capacity: 2,000 gallons an hour. No heat is used — this means an important saving in fuel!

OPERATION *Amberlite synthetic resins* are employed exclusively because of their high capacity, high exchange velocity and extreme durability. In operation, the water passes through two beds of Amberlite resins in series, which remove first the positive, then the negative, ions.

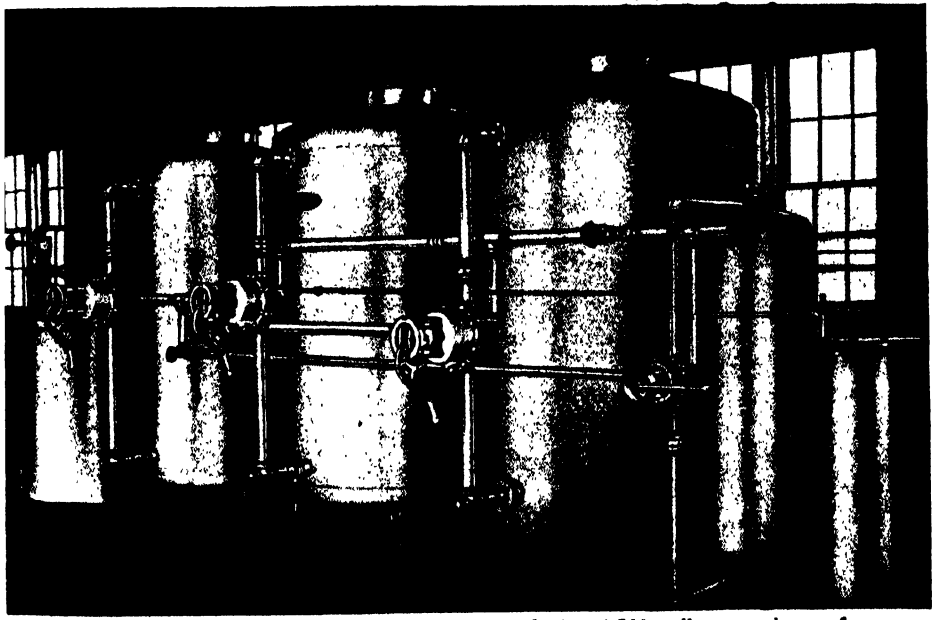
Amberlite

ION EXCHANGE RESINS

For large scale production OF DE-IONIZED WATER *at low cost*

THE production of "De-ionized" water -- water comparable in degree of purity to distilled—was made possible for the first time by the introduction of the AMBERLITE Synthetic Ion Exchange Resins in 1940.



Commercial installations of these Ion Exchange Resins De-ionizer units are in operation in a wide variety of industries where the use of very pure water in quantity is of vital importance. De-ionized water, being completely salt-free, is playing an important part in the synthetic rubber, pharmaceutical, distilling, mirror and other process industries.

Water conditioning represents but one of the possible fields of application for these unique products. The de-ionizing of sugar solutions and of gelatine, the removal of injurious heavy metals from a variety of chemicals, the de-acidification of formaldehyde, represent but a few of the many special applications now possible. Because of the inherent flexibility of the AMBERLITE Ion Exchange Resins, the possible range of applications is almost unlimited.

Have you considered this unique process in your own industry where problems of increased supplies of distilled water, condensate substitution, or other special water conditioning processes are involved?

For further data on AMBERLITE Ion Exchange Resins write the Resinous Products & Chemical Company, the sole producer of these resins in the United States.

Courtesy of Illinois Water Treatment Company

Typical AMBERLITE Ion Exchange unit producing 4,500 gallons per hour of De-ionized water—comparable to distilled water—in a synthetic rubber plant.

WASHINGTON SQUARE, PHILADELPHIA, PA.

Chemistry Comes of Age

THE half century it took the natural rubber industry to reach an annual production of 600,000 tons will be duplicated in one-twenty fifth the time by the chemical industry in providing 1,100,000 tons of synthetic rubber by 1944, Charles Allen Thomas of Dayton, Ohio, director of the Central Research laboratories of Monsanto Chemical Co., said November 12 at a meeting in St. Louis of 1,800 sales executives representing a cross section of American industry.

"Under wartime urgency, the chemical industry has been called upon to supply, in less than two years, enormous quantities of synthetic rubber raw materials. The goal is 1,106,000 tons by January 1944, and the job will be done", Dr. Thomas told his audience. Other points brought out in his interesting address follow:

After the war, instead of natural rubber alone, we shall have numerous chemical elastomers to fit specific needs. * * *

* * * In laboratories throughout the country investigations are going on behind closely guarded doors which may at any instant revolutionize the course of the war. * * *

The development of tetraethyl lead and other anti-knock chemicals has revolutionized motor fuels and motor design. * * *

The infant plastics industry has already invaded fields previously sacred to products such as metals, wood, and stone. The mechanical engineer and the plastics engineer will get together and make tougher and more durable plastics that will be used in home building as well as for the structural parts of motor cars and planes.

* * * Many of the raw materials of our chemical industry are being obtained and will be obtained in still larger quantities from our farms. * * *

The field of medicine is a striking example of what can be accomplished by a better knowledge of chemistry. It has been said that the sulfa drugs mark one of the greatest advances in medical science in the past 50 years. * * *

Even food itself is being revised. A continuous stream of new foods is emerging from the chemical laboratories—concentrated, enriched, dehydrated, precooked, quick-frozen, synthetic as well as new plant and animal varieties.

Dr. Thomas further commented on some of the ways in which the living habits of the nation may be changed in the not too distant future.

Ipatieff Honored

VLADIMIR NIKOLAEVICH IPATIEFF and his wife were guests of honor at a banquet tendered by the Chicago chapter of the American Institute of Chemists, on November 20 in Chicago.

Three important phases in the lives of this distinguished couple were celebrated; his 75th birthday, the golden jubilee of his career in chemistry, and their golden wedding anniversary.

Gustav Egloff presided and introduced the chairman, Vanderveer Voorhees.

Frank C. Whitmore spoke on "Ipatieff—His Influence on World Chemistry", Professor Ipatieff discussed, "My Twelve Years in the U. S. A.", Dr. Egloff spoke on "Ipatieff's Influence on Industry", and Ward V. Evans paid tribute to "Ipatieff, the Scholar".

Metal Cleaning

THE first of a series of reports on the use of Dresinate in specific industries has been made in a booklet just issued by Hercules Powder Co., Wilmington, Del., for metal cleaning. Dresinate, the neutral sodium salt of selected rosins, is a dry, free-flowing powder, with each particle water-soluble.

Dresinate, in its various types, produces rapid wetting of surfaces, emulsifies oils, greases, and other types of dirt removable with alkaline cleaners, and maintains the soil in suspension to assure a thorough rinsing action. It also makes possible a replacement of solvent baths by alkaline baths.

Manufacturers' War Posters to Be Shown during War Congress

AN EXHIBIT of representative war production posters designed for and used by manufacturers since last December 7 will be one of the feature attractions of the War Congress of American Industry that convenes in New York, December 2, 3, and 4.

The posters, to be selected by a jury of three experts in the field of personnel management, advertising, and poster art, will be examples of what have done outstanding jobs in building employee morale or combatting industrial problems that threatened to impede production.

The exhibit is arranged by the War Committee of the National Association of Manufacturers to give the industrialists who will attend the congress ideas and suggestions for use in their own plants.

Fertilizer Supply Ample for Next Year

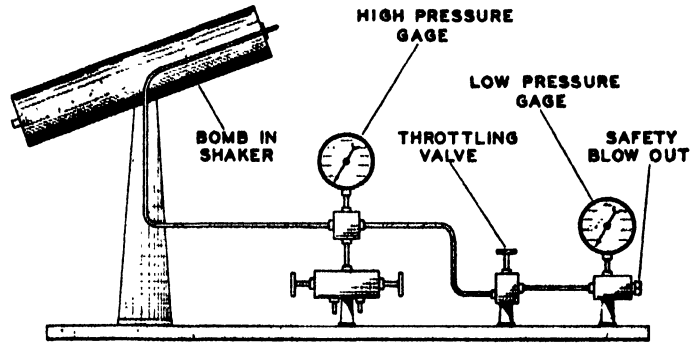
AMERICAN farmers will be able to get most of the fertilizer they need to meet crop production goals next year, Frank W. Parker of the U. S. Department of Agriculture, said November 12, in a talk before the American Society of Agronomy meeting in St. Louis.

Dr. Parker, who is in charge of soil and fertilizer investigations in the department, indicated there would be a record demand for fertilizers owing to the great increase in farm cash income for 1942. He predicted there would not be enough nitrogen to meet this demand but said there would be enough for essential requirements and to enable American farmers to meet crop production goals. Adequate supplies of both phosphate and potash were predicted.

Testimonial Dinner of Ralph L. Evans Associates

IN APPRECIATION of their efforts and accomplishments during the year, Ralph L. Evans Associates, 250 East 43rd St., New York, N. Y., reversing the usual practice, gave a testimonial dinner for its own staff on October 30 at the Hotel Biltmore. Sixty-eight attended.

Hydrogenation Apparatus for the Investigation of EXPLOSIVE REACTIONS



AMINCO now offers a solution of the otherwise hazardous problem of investigating chemical reactions liable to explode, by introducing apparatus for ascertaining the safe limit of operation without the hazard of explosion. This apparatus is one of the many offered by the Aminco Superpressure Division which keeps abreast of the latest developments in the modern field of superpressure technique.

AMINCO

AMINCO engineers have specialized in Superpressure and Catalytic Hydrogenation Apparatus ever since the inception of this modern technique, and they have maintained a leading position in this field. Much of the synthetic organic chemicals now in use in the fields of science and general commerce was first produced in Aminco apparatus, and hundreds of laboratories are now using Aminco apparatus for further extension of these studies.

★

Write for New Catalog NP406

Schematic Diagram of Aminco Apparatus for the Study of Explosive Reactions

This apparatus differs from the standard Aminco Hydrogenation Apparatus in that: (1) a special bomb is used, which may be tested for pressures up to 100,000 lb. per sq. in., depending on conditions; (2) a high-pressure gage is connected to the bomb, and a pressure gage is mounted in parallel with it (a novel arrangement prevents the latter gage from bursting should an explosion occur within the bomb).

ACETONITRILE
CH_3CN

A new chemical already very important in vitamin synthesis. It is a stable, clear, colorless liquid miscible with water, alcohol, acetate esters, acetone, fatty acids, and cellulose acetate and nitrate. Its insolubility in oils, fats and hydrocarbons suggests its use as an extraction agent to purify lubricating oils, waxes, etc. Its low boiling point of 82°C. makes it easily recoverable. Its constant boiling mixture with water boils at 76°C. and consists of 84% Acetonitrile and 16% water.

NECROLOGY

William Hussey Adams

WILLIAM HUSSEY ADAMS died in Newark, Del., on October 26. He took his technical training in chemistry at the Massachusetts Institute of Technology, from which he was graduated in 1891. He became connected with the Silver Springs Bleachery, Providence, R. I., as chemist, and held this position for several years. For over 40 years he served the Wm. L. Barrell Co., New York and Boston, first as chemist, later as vice president and general manager of the Eastern Finishing Works, a subsidiary organization, and finally as technical adviser to the New York office, a position that he held until his retirement in 1939.

Mr. Adams' work lay largely in the field of heavy cotton fabrics and he made many contributions, especially in the art of waterproofing and mildew-proofing such fabrics. He had numerous patents and publications in this and related fields.

Mr. Adams had been a member of the AMERICAN CHEMICAL SOCIETY since 1917.

Albert L. Barrows

ALBERT L. BARROWS, executive secretary of the National Research Council, died in Washington, D. C., November 7, at the age of 59.

Dr. Barrows received the M.S. and Ph.D. degrees from the University of California, taught for three years at the Science High School, Cavite, Philippine Islands, and later served as instructor at the University of California. During World War I he entered the Army as lieutenant and was promoted to captain while in France with the 347th Machine Gun Battalion. He was later lieutenant colonel in the 320th Infantry Reserve. He went to Washington in 1919 as assistant secretary of the National Research Council, and became executive secretary in 1934.

He was a member of the American Association for the Advancement of Science, the California Academy of Science, the Paleontological Society, the Biological Society of Washington, and the Cosmos Club. He was a member of the Advisory Committee to the State Department for Exchange Fellowships and Professorships.

David W. Haering

DAVID W. HAERING, an authority on corrosion by water, died October 30, in Chicago, Ill., at the age of 34. Mr. Haering was born in Chicago and received his Ph.C. degree from the University of Illinois in 1929. He was the president and technical director of D. W. Haering & Co., Inc. Under his direction the research laboratories developed 28 different organic glucosides for the control of scale and corrosion in aqueous systems.

Mr. Haering served as consultant for the Government on war camp sites and was the author of "Organic Methods of Scale and Corrosion Control". He was a member of fourteen chemical and engineering societies, including the AMERICAN CHEMICAL SOCIETY, which he joined in 1934, and formerly served as president of the American Society of Refrigerating Engineers.

John Helfrich

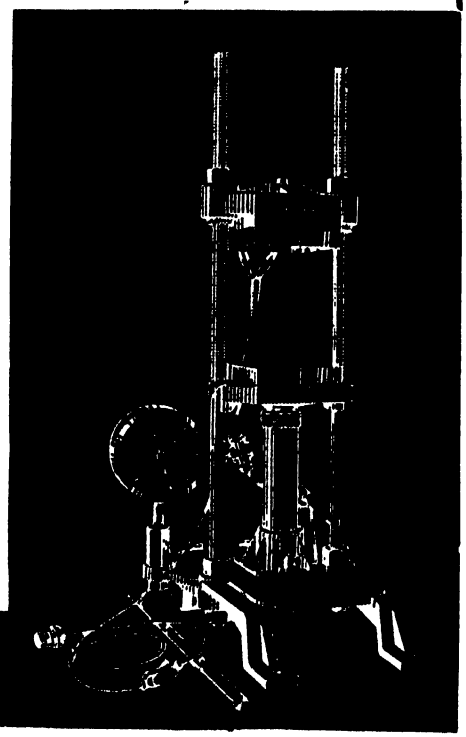
JOHN HELFRICH, chief chemist of the publishing laboratories of William Randolph Hearst, died November 10 at Ridgewood, N. J., at the age of 61. Mr. Helfrich was born in New York, was employed for some time by the Chemical Catalog Co., and for 10 years had been chief chemist for Hearst. In 1924 he became a member of the AMERICAN CHEMICAL SOCIETY.

Louis Krumbhaar

LOUIS KRUMBHAAR, formerly secretary of the Solvay Process Co., died November 5 at the age of 81. He was born in Paris, France, and spent his early years in Philadelphia. He was a graduate of Harvard University.

Stanislas Pilat

STANISLAS PILAT, noted Polish chemist, died recently in Lvow. Until the outbreak of the war he was connected with the Polish State Refineries. He was a prolific writer, specializing in the chemistry of naphthenic acids and their derivatives, and was particularly interested in the synthesis of compounds that simulated or excelled the properties of natural hydrocarbons. He had been a member of the AMERICAN CHEMICAL SOCIETY since 1927.



THE CARVER LABORATORY PRESS

Standard Equipment for experiments in oils, wax, fibrous materials, plastics and many other substances which require a press that is accurate, simple in operation, powerful, small and compact — complete accessories.

The characteristic design of The Carver Laboratory Press is well known. The press and certain of its accessories are patented.

Louis J. Plumb

LOUIS J. PLUMB, president of the United States Rubber Reclaiming Co., died in Bronxville, N. Y., on November 7 at the age of 58.

Mr. Plumb entered the employ of the United States Rubber Reclaiming Co. in 1905 as chemist, a year after graduation from Princeton University. The company was the second in the business to employ a chemist, and Mr. Plumb was credited with important work in introducing the scientific method in the industry. He obtained the master's degree from Princeton in 1907, with a thesis on the chemistry of rubber. He became chief chemist of the company in 1910, later sales manager, and vice president, and in 1925 was made president and treasurer, positions which he held until his death. He was also president of the D. S. Plumb Co., manufacturer of clock works and intricate machinery, a firm founded by his father.

Mr. Plumb was chairman of the executive committee of the Rubber Reclaimers' Association, where he acted as a liaison expert between the entire industry and the War Production Board. He had been president of the association. In 1910 he joined the AMERICAN CHEMICAL SOCIETY, and was active in the formation of the Division of Rubber Chemistry.

Leopold Singer

LEOPOLD SINGER, well-known petroleum chemist, died in London on June 10 in his 73rd year.

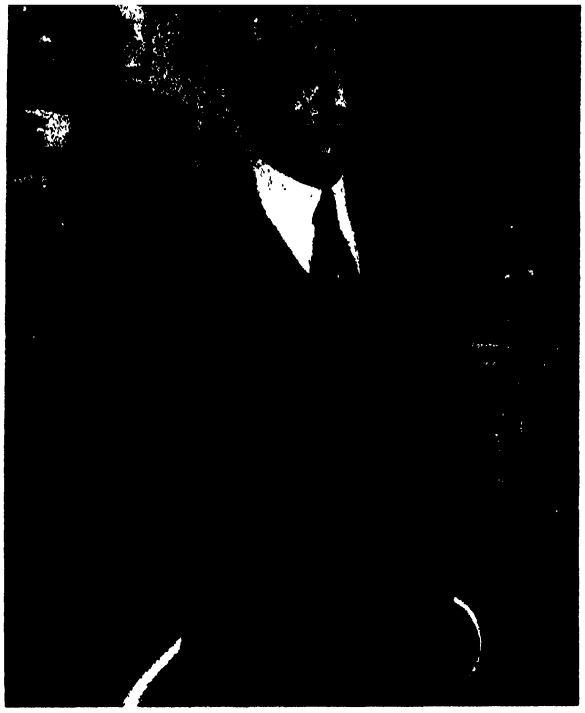
Dr. Singer was a native of Vienna, and a graduate of the University of Vienna and the Zurich Polytechnic Institute. He started his practical career in his father's refinery at Orsova, and began to replace empirical methods by more scientific methods. The sweetening of gasoline, the use of fuller's earth, and the recovery of low-boiling point gasoline from distillation gas were his inventions. In 1903 he took charge of the Fanto A. G. in Czechoslovakia, and held the position until 1912, developing it until it became one of the biggest and best equipped refineries in Europe. In 1914 he took charge of the completion and management of the lubricating oil plant of the Rhenania Refinery in Düsseldorf. In 1918 he was appointed consultant to the Allgemeine Depositenbank in Vienna, and in 1926 joined the staff of the Universal Oil Co. as chemical consultant and was connected with this company until the time of his death.

Dr. Singer had taken out many patents, especially on fractionating columns, high-vacuum distillation plants, production of lubricating oil and paraffin wax, etc. He was the author of numerous books and scientific articles. Since 1927 he had been a member of the AMERICAN CHEMICAL SOCIETY and since 1925 had been actively associated with the Institute of Petroleum.

One plate of stainless steel if rolled into a plate of Jessop Silver-Ply Stainless-Clad Steel (20%) cladding, will make available 5 *times* more stainless surface.

Use of 5% to 50% Silver-Ply Stainless-Clad Steel conserves strategic alloys for the war effort . . . and you still have the desired protection of stainless steel on the clad side, strength from the mild steel backing and better thermal conductivity. It also economizes on material costs with savings up to 45% as compared to solid stainless.

If your operations involve processes where corrosion of equipment must be avoided and product purity must be maintained, Silver-Ply Stainless-Clad may solve your problems, for it is corrosion resisting, stain-free and easy to clean.



Write for descriptive booklet listing applications for processing and storage equipment for use in your specific industry.

*Manufactured under U. S. Pat. Nos. 1,997,538 and 2,044,742

Presentation of Memorial Portrait

Portrait of Alexander Lowy, painted by N. MacGilvary, Department of Painting and Design, Carnegie Institute of Technology, presented to the University of Pittsburgh recently by the chemistry alumni, faculty, and students. W. L. Baldwin, assistant professor of chemistry, presided as chairman of the Memorial Committee.

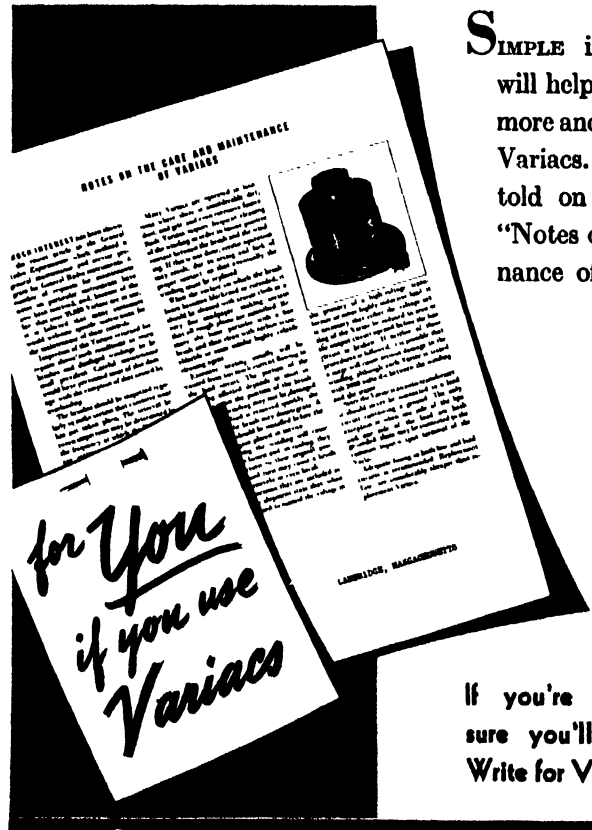
From a Patriotic Professor to One of His Star Students

Dear John:

I WAS certainly shocked to get yours of the 12th and to learn that you are considering the peculiar kind of patriotism represented by giving up your years of training and experience in chemistry at a time when that type of training and experience is so badly needed in the war effort. Apparently you have gotten out of touch with things to the extent that you do not realize that chemistry is needed primarily in the production army and not in the combat forces.

Have you kept up with the situation as given in CHEMICAL AND ENGINEERING NEWS? For instance, in the October 10, 1942, issue on page 1219, there is a column about you and men like you who think that this is still the Battle of Lexington.

Most certainly, I shall not write a letter of recommendation for you to join the Reserve. First of all, I do not believe in the move from the point of view of winning the war, and secondly, if I were honest about it, I would have to certify that something has happened to your mind which I cannot pretend to understand.



Try to wake up and do your bit.

Perhaps you feel that you are not now doing the most you can by means of your chemistry for the winning of the war. You should stop and realize that as an entire nation, we are probably not yet over 10 per cent into total war. When we really go all the way, we shall be in a desperate position for chemical talent. The only chemical reserve which we have consists of men who are not *yet* in full war work.

I have scores of letters from chemists in the Army and the Navy in the U. S. A., England, and Australia, who are completely upset because the work they are doing could be done exactly as well by any liberal arts graduate, either with or without freshman chemistry. I sincerely hope you will not swell the ranks of these misplaced chemists.

If you can't get straightened out on the facts, please write me again and freely. I have only one interest, namely, to win the war.

RICHARD ROE

SIMPLE inspection and cleaning will help you get longer life plus more and better service from your Variacs. What to do is concisely told on a single sheet entitled "Notes on the Care and Maintenance of Variacs." The simple procedures described will save hours that would otherwise be lost in making repairs or replacements and will help conserve materials vital to the war effort.

If you're using Variacs, we are sure you'll find this sheet useful. Write for VARIAC SHEET No. 811.

Cambridge, Massachusetts

War Training Evening Courses in Industrial Chemistry

THREE war training evening courses in industrial chemistry have been inaugurated by the Case School of Applied Science, Cleveland, Ohio, free of charge. These cover industrial materials analysis, chemical engineering for production supervision, and explosives. Classes began November 16, 1942.

Scrap Campaign Sound Film

AN INDUSTRIAL film, "Let's Get in the Scrap", is being widely used as a means of educating executive personnel on how to organize and successfully conduct an in-the-plant metal salvage campaign.

Prepared by the National Association of Manufacturers, New York, N. Y., with the approval of the War Production Board's Conservation Division, the film, released in early September, is being used by upwards of 350 industrial plants, institutions, and associations.

The 20-minute sound-slide film can be shown on standard 35-mm. projector equipment.

NEWS-MAKERS

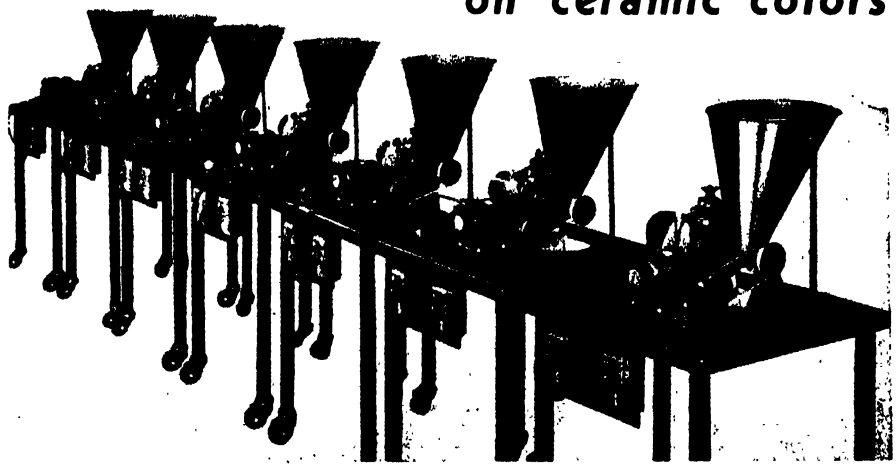
Captain James B. Cordiner, Jr., completed the nine weeks' general staff course at the Command and General Staff School, Fort Leavenworth, Kans., in September, and is now assistant supply officer at the antiaircraft training center at Camp Stewart, Ga.

W. L. Faith

W. L. Faith, formerly head of the Division of Chemical Engineering, Kansas State College, is beginning his duties as professor and head of chemical engineering at the State University of Iowa, Iowa City, Iowa.

Pieter Honig

Pieter Honig, former director of the Experimental Station of the Java Sugar Industry at Pasoeroean and during the past year director of the Rubber Research Institute at Buitensorg, Java, left Java just before the surrender of the Netherlands-Indies to the Japs and came to the United States. He has been appointed commissioner of the Board for the Netherlands-Indies, Surinam, and Curacao, New York, N. Y., and will direct postwar reconstruction problems in relation to the agricultural industries of the Netherlands-Indies.



H. J. Mandernach has been appointed sales manager of the Replacement Tube Section, General Electric Radio, Television, and Electronics Department, Bridgeport, Conn.

Lieutenant Frederick A. Meier is now serving as special service officer in the Troop Carrier Command of the U. S. Army Air Corps. He was previously instructor in general and organic chemistry at the Bridgewater Teachers College, Bridgewater, Mass. He is located at the Florence Air Base in South Carolina.

John C. Mertz has resigned as assistant professor at the University of Connecticut to accept a position as metallurgist at the Pratt and Whitney Division of the United Aircraft Corp., East Hartford, Conn.

Geo. W. Muhleman, who was retired from Hamline University in June 1941, has

Battery of "Lab" Mills used on ceramic colors

Raymond Laboratory Units

(Interior view) Cover removed from grinding chamber, showing rotor with swing hammers and screen in base of the mill.

are specially adapted for product development work, for preparing test samples and for experimental research in connection with powdered materials.

The Laboratory Mill is a small capacity grinding unit, capable of handling a few pounds at a time. It produces the *same character* of finished material as the commercial size pulverizers. Driven by a motor mounted on rotor shaft, and equipped with a hand-operated feeder on standard mill. Also furnished with power driven feeder, as shown above.

The Laboratory Air Separator is a 10-inch diameter motor-driven unit for classifying small quantities of dry powdered materials or for separating the grind of laboratory size mills. Set of interchangeable whizzers and fans furnished with it for regulating the fineness.

become acting associate professor of chemistry and head of the Department of Inorganic Chemistry of the North Dakota Agricultural College, Fargo, N. Dak., for the duration. For the year 1941–42 he was visiting professor at Alma College, Alma, Mich.

Robert T. Olsen has completed requirements for the degree of Ph.D. in organic chemistry at the Massachusetts Institute of Technology and is now employed as research chemist at the Grasselli plant of the General Aniline & Film Corp., Maplewood, N. J.

F. W. Parker, E. I. du Pont de Nemours & Co., Inc., has accepted appointment for the duration of the war as chief, Division of Fertilizer Research, Bureau of Plant Industry, U. S. Department of Agriculture, succeeding **R. M. Salter**, who has been made chief of the bureau.

Harold L. Parks has been transferred from the Eastern Laboratories to the Wabash River Ordnance Works, in Indiana, where he will serve as laboratory consultant, supervising the construction and setting up of four laboratories in the high explosives section.

D. E. Pierce resigned his position with the Röhm & Haas Co. in May to become engineering assistant to **J. S. Bates**, vice president in charge of manufacturing, General Aniline Works Division, General Aniline & Film Corp. He has just been transferred to the position of chief engineer of the division, with headquarters at Grasselli, N. J.

Milton W. Powell, Jr., recently resigned as chief, Crown Cap Section, Manufacturing Division, Research Department, Continental Can Co., to take charge of the Connellsville, Penna., laboratory of the Anchor Hocking Glass Corp.

W. J. Reagan has been appointed melt shop research metallurgist with the

W. J. Reagan

Copperweld Steel Co., Warren, Ohio. He was previously connected with the Edgewater Steel Co.

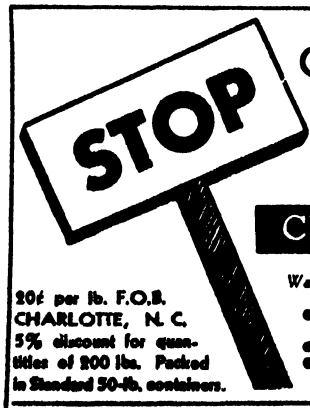
Wm. B. Reynolds has accepted a position as assistant professor of applied science, College of Engineering and Commerce, University of Cincinnati. He was formerly instructor in chemistry at the University of Chicago.

Merrill L. Riehl has resigned his position as civil engineer, Division of Water, Columbus, Ohio, to accept the position of associate sanitary engineer, U. S. Army Corps of Engineers, with headquarters at Columbus.

Charles W. Rippie, formerly petroleum technologist for the Solvay Sales Corp., has joined the Petroleum Chemicals Department, Organic Chemicals Division, Monsanto Chemical Co., St. Louis, Mo., where he will handle technical sales work.

Joseph Robitschek has been engaged by The United States Stoneware Co. to take charge of its ceramic research program, with headquarters at Tallmadge, Ohio. Dr. Robitschek has had much experience in the production of chemical stoneware and refractory materials in Czechoslovakia, Belgium, France, and Germany.

Howard F. Shenton, formerly a consulting chemical engineer for the Design Department, Tennessee Valley Authority, has accepted a position as chemical engineering assistant to the production manager of the Agfa Ansco Division, General Aniline & Film Corp., Binghamton, N. Y.



Jack Sherman has been granted a leave of absence from the research laboratories of the Texas Co. and is in Washington, D. C., engaged in defense work as physical chemist for the National Defense Research Council, Office of Scientific Research and Development.

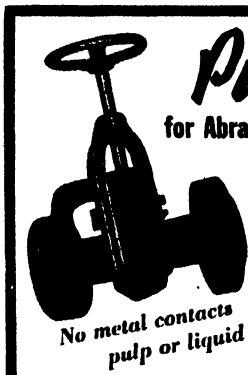
J. A. Stekol, assistant professor of biochemistry at the Vanderbilt University Medical School, Nashville, Tenn., has joined the U. S. Army and is stationed at the Station Hospital, Camp Blanding, Fla.

Hutton W. Theller has been granted a research fellowship in cellulose chemistry by The Sylvania Industrial Corp., Fredericksburg, Va. Mr. Theller is a candidate for the Ph.D. degree in the Department of Pulp and Paper Manufacture, New York State College of Forestry, Syracuse University, and will continue his research at this institution.

Virgil Tweedie has recently joined the research staff of the Commercial Solvents Corp., Terre Haute, Ind. He was previously at the University of Missouri, where he was doing graduate work.

Edward A. White, formerly analytical research chemist with the Calco Chemical Division, American Cyanamid Co., is now in Washington, D. C., as sales representative of the Winthrop Chemical Co., New York, N. Y.

GAS and ACID Leaks *with* CHARLAB



CHEMICAL PUTTY

Waterproof—Acid Resistant—Stays Plastic

- Stops Gas and Acid Leaks at Flange Joints
- Packs Expansion Joints Excellently
- Makes Tight Joints at Bell and Spigot Connections

No metal contacts pulp or liquid

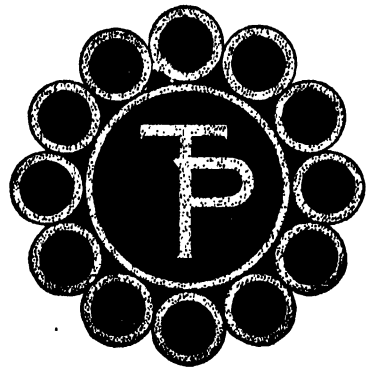
Pinch VALVES

for Abrasive or Corrosive Pulps and Liquids

Made with rubber or synthetics, the Massco-Grigsby Pinch Valve is more resistant to wear than metal valves. Shuts tight even on solid particles... withstands freezing. Useful for solutions which are highly corrosive or which crystallize at normal temperatures and must be handled hot; for solutions or solids which are both corrosive and abrasive. Sizes from 1" to 12". *When writing please state your problem.*

The MINE AND SMELTER SUPPLY CO., Denver, Colo.

NEW 1600°F. FANS



Despatch announces a complete line of all welded heavy duty acid resistant fans having capacities ranging from 1000 to 20,000 C.F.M. These fans have been thoroughly tested on Despatch ovens and dryers over a period of seven years. They are now offered to the trade for the first time.

Choose a Despatch fan for your next heavy duty, acid resistant fan requirement. Note the improved performance and the long trouble-free service it will provide.

Write for design and construction details, prices and performance data.

A C E
SPHERICAL
JOINTS
U. S. Pat. No. 2,190,220

Made to ACE specifications, these spherical joints will meet your performance specifications.

They permit considerable angle changes without the need for complicated adjusting devices.

They eliminate breakage of equipment and joint leakage resulting from inaccurate alignment.

It's easy to install spherical jointed equipment, too. Just approximate your locations, slide the sections together and clamp them. The ACE clamp connects the members simply and effectively.

For final adjustment, align the parts to desired positions and tighten the clamps firmly.

Write for the Ace General Catalog 40 which includes a wide selection of spherical jointed apparatus.

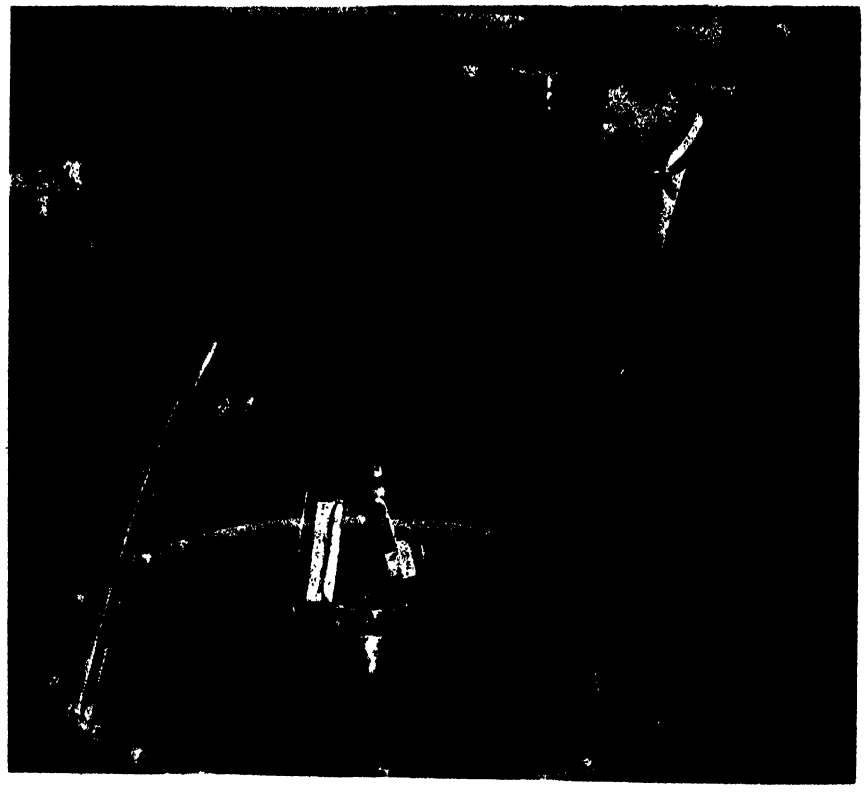
Beilstein's Handbook Is to Be Reprinted

THE Alien Property Custodian has seized the copyright rights to the fourth edition of "Beilstein's Handbuch der organischen Chemie", the "bible" of the organic chemist. This work was originally published by Julius Springer, who issued Volume I of the main series in 1919. Subsequently, additional parts were released at irregular intervals until there are now 29 volumes of the Hauptwerk, plus a subject and formula index. There are also 27 volumes of the first and one of the second supplements, a total of 59 in 49 covers since more than one volume of the first supplement has in several instances been put in one binding. The cost of this set has been about $1800.

Because of the importance of this reference work in the war effort and because many of the earlier volumes need replacement, arrangements have been made by the Alien Property Custodian with Edwards Bros., Inc., lithoprinters, Ann Arbor, Mich., to copy photographically and reprint the entire series by the offset process.



The only noticeable difference between the new and the original printing will be in the paper and binding. The former will be heavier and more durable, the latter standard library buckram.

The printing schedule calls for delivery of the first volume in December, completion of the work before next March. Whole sets are to be sold for $400. Individual bindings will cost $12.50 each. Many libraries have already ordered a second set to decrease the wear and tear on the one now in use.

First Three Volumes of Chemical Abstracts Reissued

INCOMPLETE sets of *Chemical Abstracts* have been accumulated by many libraries. It appears in a majority of cases that the shortages are Volumes 1, 2, and 3. Consequently, arrangements have been made with Edwards Bros., Inc., lithoprinters, Ann Arbor, Mich., to reproduce these three volumes with the full approval of the AMERICAN CHEMICAL SOCIETY and sell them, unbound, at $25 each. Owing to mechanical difficulties the page size (5.5 × 8.5) will be slightly smaller than the original but the paper will be a little heavier. The printing will be finished in December. Since this work is undertaken solely to meet current demands very few extra copies of any issue will be made beyond those actually ordered.

Should sufficient interest be shown, this project may be extended to include the first Decennial Index. All orders and correspondence should be sent to Edwards Bros. direct.

Plastic for Bomber Nose

Donald S. Frederick, recipient of the John Wesley Hyatt Award, examines the "nose" of an American bomber molded from large transparent sheets of methyl methacrylate plastic. The sections are accurately curved to conform to the contours of a plane. New fabricating methods were developed to form dome sections to meet the high optical standards required.

The Amateur Scientist. *W. Stephen Thomas.* 291 pages. W. W. Norton & Co., Inc., 70 Fifth Ave., New York, N. Y., 1942. Price $3.00.

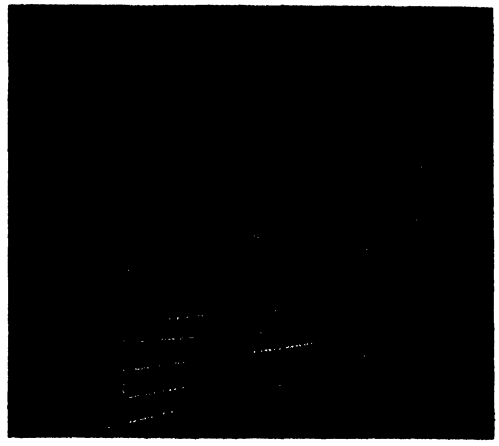
SCIENTIFIC pursuits in amazing variety provide satisfying and stimulating avocations for a growing number of intelligent people. The appeal of science extends to persons in all walks of life and of all ages. The present book is primarily a survey of amateur science and an attempt to evaluate its social significance. Its author is executive secretary of the Committee on Education and Participation in Science of the American Philosophical Society. He is well qualified for the task and his book demonstrates this.

But the discussion of amateur scientists, their projects, their methods, and their organizations goes further than one would expect of a mere sociological survey. The accounts of the activities of individuals and groups suggest avenues by which others similarly inclined may share in the enjoyment of scientific pursuits. Indeed, the projects described and the methods employed in them proved fascinating to this reviewer. Naturally the subjects discussed fall largely into the category of nature study as being the most easily accessible field for the amateur.

National Formulary, VII. *American Pharmaceutical Association.* 960 pages + index. Mack Printing Co., Easton, Penna., 1942. Price, $6.00.

THE first edition of the National Formulary was published in 1888 to bring uniformity in medicinal preparations not recognized by the U. S. Pharmacopoeia. The Food and Drug Act of 1906 gave the National Formulary equal recognition with the U. S. Pharmacopoeia, and this was followed by the Food, Drug, and Cosmetic Act, thereby making the preparations used by physicians uniform all over the United States.

To comply with the requirements of the Food and Drug Administration all physiological titles have been eliminated. Preparations deleted from the Pharmacopoeia have been added, and many proposed for the National Formulary have been included in the new Pharmacopoeia.



Directions for storage of drugs, alcoholic content of alcoholic preparations and average doses have been given. Uniform colors for drugs and chemicals are stated, tests for identification and strength are given wherever possible, thus providing standards for quality and purity, and where possible assays, both chemical and physiological, are included. A most complete list of reagents and tests, and also stains for bacteriological work, are included.

National Formulary VII is far in ad-

VITREOSIL
(VITREOUS SILICA)
for ultra-violet transmission

TRANSPARENT TUBING
Manufactured by the fusion of pure rock crystal, Transparent Vitreosil Tubing is highly efficient for transmitting ultra-violet — as well as visible light and infra-red radiation. Mechanically strong, resistant to devitrification, and gas penetration, it is ideal where vacuum-tightness is required in sealed apparatus.

Standard sizes range from 1/32 in. to 1 1/4 in. I.D., but much larger sizes are made to order. Multi-bore and non-circular cross-sections are also available.

TRANSPARENT RODS
Owing to its remarkable conductance of radiation around curves, transparent Vitreosil Rods may be bent in manufacture in order to provide transmission of ultra-violet or visible radiation into otherwise inaccessible places. Ends may be polished or finished optically.

Transparent Vitreosil Rod Constructions will not fracture with temperature changes and so may be directly sterilized in an open flame or locally water-cooled. Bent transparent rod can be furnished to customers' specifications.

OPAQUE AND TRANSLUCENT QUALITIES WITH IDENTICAL CHARACTERISTICS

Vitreosil Tubing and Rod is produced in three other qualities, identical in chemical characteristics: Sand Surface, Glazed Surface and Satin Surface. The first two are opaque and the last is translucent.

As the melting point and the coefficient of expansion of all are identical, it is often advantageous to fabricate tubular apparatus incorporating various grades of Vitreosil.
Write for Bulletin No. 9.

THE THERMAL SYNDICATE, LTD.
12 EAST 46th STREET, NEW YORK, N. Y.

vance of the previous edition, and it should be in the hands of every chemist, physician, and pharmacist. Great credit should be given to E. N. Gathercoal, chairman, his successor Justin A. Powers, and the members of the Revision Committee for the fine piece of work they have performed.

The Mack Printing Co., Easton, Penna., printers and distributors of this volume, have performed a fine piece of work. The text and binding show that they used great care in the make up and headings, which are exceedingly clear.

S. L. HILTON

A Manual for Explosives Laboratories. *G. D. Clift* and *B. T. Fedoroff.* 2nd ed. 202 pages. Lefax, Inc., Philadelphia, Penna., 1942. Price, $2.00.

THIS little volume is made up of pages similar to the well known "Lefax" data sheets, bound together in loose leaf form, in order to allow for future revisions and additions, as well as for personal notes. The authors state in the foreword that it is intended to facilitate the task of those responsible for the training of personnel to work in the laboratories of the many new explosives plants now being built.

The material is grouped in eighteen chapters, of which the first ten are largely devoted to methods suitable for the laboratory control of TNT manufacture. Twenty-three pages are concerned with methods of analysis of mixed acids, oleum, and spent acids, as used in the explosives industry. There are fourteen pages dealing with the preparation and standardization of volumetric solutions. The ultimate standard recommended for alkalimetry and acidimetry is potassium acid phthalate, which seems a bit surprising for a laboratory which will be concerned almost entirely with the titration of strong acids. However, other methods of standardization are mentioned.

Three chapters are concerned with the nitration of toluene, the purification of crude TNT, and the separation and identification of the impurities.

There is a chapter on nitroglycerine, and nitroglycerine explosives, as well as one on nitrocellulose and smokeless powders. The remainder of the book contains very brief chapters on amatol, picric acid, nitrostarches, tetryl, and black powder. The final chapter deals in a rather inadequate manner with initiating substances and primers. A bibliography of 49 titles is appended. There is a table of contents but no index.

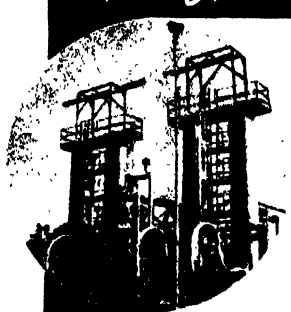
There is no doubt that this book will prove useful to the many persons now making their first contact with the explosives industries, since often the literature on the analytical chemistry of explosives is widely scattered, and more comprehensive texts are perhaps not readily available. The book is illustrated with 29 figures and diagrams.

FRANK WILCOXON

Reports of the Process of Applied Chemistry, 1941. Volume XXVI. Edited by *T. F. Burton.* 550 pages. Society of Chemical Industry, London, England, 1941.

THIS volume contains reports on the following subjects, written by British specialists: General, Plant, and Machinery; Fuel; Gas, Destructive Distillation, Tar, and Tar Products; Mineral Oils; Intermediates and Colouring Matters; Fibres, Textiles, and Cellulose—The Protein Fibres and Cellulose Textile Chemistry; Pulp and Paper; Acids, Alkalies, Salts, Etc.; Glass; Ceramics, Refractories, and Cements; Iron and Steel; Non-Ferrous Metals; Electrochemical and Electrometallurgical Industries; Fats, Fatty Oils, and Detergents; Plastics; Resins, Drying Oils, Varnishes, and Paints; Rubber; Leather; Soils and Fertilizers; Sugars and Starches; The Fermentation Industries; Foods; Fine Chemicals and Medicinal Substances; Essential Oils, Isolates, Derivatives, and Synthetics; Photographic Materials and Processes; Sanitation and Water Purification.

The book is well documented and indexed.



Without Fame. *Otto Eisenschiml.* 368 pages. Alliance Book Corp., 540 North Michigan Ave., Chicago, Ill., 1942. Price, $3.50.

OTTO EISENSCHIML has become well known for his pioneer work in the chemistry of vegetable oils and for his frequent contributions to literature, both chemical and otherwise. Earlier this year his discussion on "The Chemist's Chance" reprinted from the *Chemical Bulletin* in CHEMICAL AND ENGINEERING NEWS (March 25, page 368) aroused much interest and resulted in publication of several letters of comment.

Now, in an autobiographical account entitled "Without Fame", Dr. Eisenschiml describes in absorbing fashion the experiences which have been his in a life whose beginnings take the reader to the then-little-known Vienna of the early eighties. There is a vivid picture of the prospective chemist's early days and an equally clear portrayal of the manner in which he made his way in America, endeavoring always to make the most of opportunities to be found in his chosen profession.

The account is in a style so readable that even those who know nothing of chemical technology and little, if anything, of its terminology will have difficulty in laying the book aside until the last page is read. It is the story of one who found little that was easy in life, either in early school days when he first determined to become a chemist or after he had become well established in one branch of the chemical industry. It tells of uncertainties and of chances taken, of experiences which helped improve judgment, and of problems faced in endeavoring to adhere to high principles. There are many incidents which show the author's deter-

Specify Florite Desiccant

A NATURAL GAS PLANT is the illustration — might have been a unit for dehydrating propane, butane, gasoline, air, nitrogen, carbon dioxide, refrigeration compounds, or other fluids. All these are treated with superior drying efficiency by use of FLORITE. Hard, granular, stable, non-corrosive, non-poisonous, available in various mesh sizes. Selectively adsorbs 4 to 20% its weight of water — is regenerated by heating to 450°F. Write for literature — names of important users in your own field.

OK'd by the Best!

Sure we're bragging, but — when companies like duPont, Socony-Vacuum, Shell Oil and Warner Quinlan use our tachometer we've got a right to be proud. Portable — less than 2 lbs. in weight, Jones Hand Tachometers are ideal for speed and rating checks on revolving platens, generators, turbines and motors of all types.

Write today for further information.

JONES•MOTROLA
432 FAIRFIELD AVENUE,
STAMFORD, CONN.

mination to make the most of what fate offered at strange moments and his willingness to adjust and readjust the trend of his career in order to accomplish his purpose and reach the difficult goal.

Although Dr. Eisenschiml does not find the chemical profession above criticism, he seems never to regret having chosen chemistry as his field and his reminiscences give ample evidence that he has derived much satisfaction from his work. He has also found many opportunities to contribute to the progress of chemistry and to foster principles in which he believes.

"Without Fame" is unique in both organization and presentation, providing the reader with a great deal of informative material which interferes in no way with the fascinating story. But it scarcely warrants the modest title which the author has chosen.

H. E. Howe

Handbook of Industrial Safety Standards. 1942 ed. rev. 224 pages. National Conservation Bureau, New York, N. Y. Price, paper, $0.55; leatherette, $0.75; quantity prices on request.

This handbook was revised after American entry into the war to include the most recent accident-prevention standards. A 32-page supplement on wartime protection of industrial plants, including details of setting up and maintaining an organization to protect the plant and its employees against sabotage and air raids, has been added.

The handbook has the approval of the U. S. Department of Labor and is recommended by the U. S. Office of Education as supplemental reading in the engineering, science, and management defense training courses.

Most of the material is based upon the safety codes of the American Standards Association, American Society of Mechanical Engineers, fire underwriters, governmental agencies, and recommendations of engineering and other organizations recognized as national authorities on accident prevention. A list of safety codes is included in an appendix. Reference lists of codes applying to the particular subject discussed also are furnished.

Rationed Rubber and What to Do about It. *Williams Haynes and Ernst A. Hauser* 181 pages. Alfred A. Knopf, 501 Madison Ave., New York, N. Y., 1942. Price $1.85.

The title of this book is obviously a misnomer since there is little that the average person can do about rationed rubber except to ask his ration board for another tire and to pray. The book is entertainingly written for the general public and not for the rubber chemist. It tells of the present rubber emergency of which we all should be, and probably are, conscious. The wide and varied uses, the history, and properties of rubber are recounted at length, although this has all been told before. Advice similar to that appearing in rubber company advertisements on the care of rubber articles is given.

There are a number of statements with which rubber chemists generally would disagree. For example, it is stated that rubber cannot be processed with Vistanex. The reviewer has never heard the wildest guesser claim that there are a *billion* tons of scrap rubber in the country. Although it is stated that we should have available about 75,000 tons of rubber annually with our supply from the Far East cut off, the same paragraph says that *98 per cent* of our rubber came from the Far East. These two values do not agree with the figures for even the extraordinary consumption of rubber in 1941. Polysulfides do not react with hydrocarbons to yield Thiokol, but with halogenated hydrocarbons and other halogenated materials. There is some discussion of the political aspects of the synthetic rubber situation, but little that has not already appeared in the daily press.

The L. S. O. G. Exchange

Edited by A. A. Ashdown, Ed. F. Degering, J. E. Hawkins, and S. L. Redman

Send items to Ed. F. Degering, Department of Chemistry, Purdue University, Lafayette, Ind.

THE Panhandle Plains area is not a highly industrialized section of the State. Within the boundaries of our local section there are perhaps 100 chemists eligible for membership in the A. C. S. The bulk of our membership is drawn from three localities, Pampa, Borger-Phillips, and Amarillo, Tex. The balance is scattered over the seven counties that are represented in our local section.

One of the prime objectives of this section, therefore, has been to provide a program that will overcome the feeling of isolation that develops when a man is cut off from association with others of his profession. We have made it a practice since the organization of this section to have one meeting a month from September through May or June. These are always dinner meetings and have been held in Amarillo, Pampa, Borger, or Canyon. They offer a social contact with other chemists that would otherwise be lacking.

As this is a small section we must utilize local talent in most of our meetings. We try to have three or four of the A. C. S.-sponsored speakers during the year.

In this particular section all nonmember chemists are known and their names are on the prospective membership list. Every member is on the Membership Committee. When a member of the A. C. S. moves into the Panhandle he is invited to attend our meetings and to participate in the affairs of the organization.

The A. C. S. is filling an important place in the Texas Panhandle. Interest is shown by the fact that, while our membership is only slightly over 50 and the average number of miles driven in order to attend a meeting is well over 100 (round trip), the average attendance is over 30.—ROY E. KING, *Panhandle Plains Section.*

The Brown Co. reports net profit of $906,190 for the first 44 weeks of the first fiscal year following reorganization under the Bankruptcy Act, after providing $1,200,000 for estimated federal income and excess profits taxes. The company's working capital, after repaying $1,878,836 on its long-term Reconstruction Finance Corp. loan and the transfer of $1,284,930 bond interest from long-term debt to current liabilities, was $5,567,976 on October 3, 1942.

The Champion Paper & Fibre Co. has sold privately to institutional investors an aggregate of $11,000,000, 3.75 per cent first mortgage bonds due in 1957. Proceeds will be used to retire 4.75 per cent debentures due in 1950, which were outstanding in the amount of $8,020,000 on November 1, 1942, and for general corporate purposes.

According to the Division of Industrial Economics, National Industrial Conference Board, profit margins in the metal products, automotive, and chemical industries, all heavily engaged in the production of armament, were much lower in 1941 than in 1940. Margins were also lower in the paper and allied products, stone, clay, and glass products industries, but higher in forest products, petroleum, and coal products industries. In 1941 the United States factories handled about $30,000,000,000 more in dollar volume and 30 per cent more in physical volume than in 1940. Earnings on sales, after taxes, dropped to 5.4 per cent from 6.1 per cent in 1940 and 4.5 per cent in 1936. In 1940 manufacturers earned 8.0 per cent before taxes per dollar of sales, and 6.1 per cent after taxes.

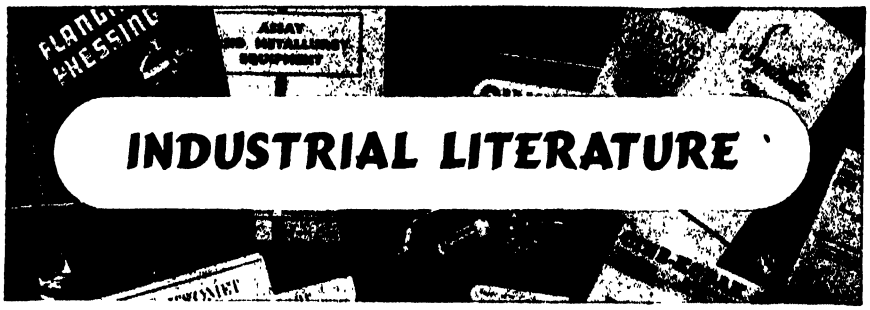
According to a survey of American corporations made by the Securities and Exchange Commission, net sales of a group of 38 corporations engaged primarily in the manufacture of chemicals totaled $1,755,000,000 in 1941 against $1,253,000,000 in 1940. Net profit from operations in 1941 totaled $431,000,000 against $275,000,000 in 1940, and net profit after all charges was $223,000,000 and $210,000,000, respectively.

Through its sale of stock of Basic Magnesium, Inc., $525,000 was received by Basic Refractories, Inc., according to a report filed with the Securities and Exchange Commission. The transaction covered all the stock of Basic Magnesium owned by Basic Refractories.

Alien Property Custodian Aquisition of American Potash & Chemical Stock

On October 29 the Alien Property Custodian announced that he had taken over 480,000 shares of American Potash & Chemical Corp. stock owned by foreign nationals, stating that the action implied no criticism of the present officers and directors of the company.

A statement by F. Cecil Baker, president of the company, explains that the stock in question was sold by Consolidated Gold Fields of South Africa, Ltd., a British company which had been responsible for the financing and development of the Trona enterprise since its inception in 1913, to Hope & Co., of Amsterdam, one of the most respected banking houses in the Netherlands. This sale took place in 1929. Since that time the officials of American Potash & Chemical had been assured many times by Hope & Co. that none of the stock was being held for the benefit of German interests.



Movie on Fabrication of Aluminum

A new series of instruction films on the fabrication of aluminum has been released by the Bureau of Mines, U. S. Department of the Interior, 4800 Forbes St., Pittsburgh, Penna. In cooperation with a large industrial firm three films—"Machining Aluminum", "Riveting Aluminum", and "Welding Aluminum"—have been made in 16-mm. sound, and are available for industrial defense training classes, schools, and similar groups.

Correction

An error was made in the September 25 issue of Chemical and Engineering News. In captioning picture 3, page 1165, the person on the left was identified as J. De Bell. We now have information that the photograph is of H. R. Johnston, Pratt & Lambert, Inc.

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

Alloy Steel Data Sheet. A new, compact chart showing analyses, physical characteristics, and applications of 19 different stainless steel, Monel, and nickel alloys has just been published. This also contains a handy cross reference of designations and type numbers of the Alloy Casting Institute, the American Iron and Steel Institute, American Society for Testing Materials, Society of Automotive Engineers, U. S Navy, and others. This reference chart is standard letter size and can be conveniently filed. *Booklet CEN.* THE COOPER ALLOY FOUNDRY Co., Hillside, N. J.

Anhydrous Hydrofluoric Acid. A 28-page illustrated booklet gives a compilation of published work on the properties and uses of anhydrous hydrofluoric acid. *Booklet CEN.* THE HARSHAW CHEMICAL Co., 1945 East 97th St., Cleveland, Ohio.

Belt Conveyor Pulley. This pamphlet describes a boot and a tail pulley claimed to save vital materials, time, shut-downs, and maintenance costs, and applicable to bucket elevators as well as belt conveyors. Damage to belts from materials getting between the pulley and the belt is eliminated. Photographs and a table of specifications are included. *Bulletin 3001 CEN.* SPROUT, WALDRON & Co., 100 Sherman St., Muncy, Penna.

Branch Pipe Outlets. This bulletin describes a line of WeldOlets, ThredOlets, and socket-end WeldOlets which, it claims, are three different types of fittings, each designed for a particular application and all designed for making the strongest possible right-angle, welded branch pipe in the least amount of time at the lowest cost. Photographs, line drawings of installations, and dimension, size, weight, and price tables are given. *Bulletin WT-31 CEN.* BONNEY FORGE AND TOOL WORKS, FORGED FITTINGS DIV., Allentown, Penna.

Chemical Porcelain. A well-illustrated catalog on glazed, wet process porcelain includes pipes and fittings, cast iron flanges, Y-type and angle valves, spacers, and Raschig rings. Dimension tables and line drawings of each product give complete information. *Catalog C-1 CEN.* ILLINOIS ELECTRIC PORCELAIN Co., Macomb, Ill.

Dehydration. A bulletin on tube and spray drying of foods gives data on this comparatively new industry. A discussion of dehydrating with inert atmosphere is followed by a description of a tube and a spray dryer. Dimensions and flow charts are included, as are foods which can be treated by each type of unit. *Bulletin CEN.* BOWEN RESEARCH CORP., Garwood, N. J.

Equipment Manufacturers. Under the title "Koven Men and Machines for War Work", this well-illustrated brochure tells the story behind the manufacture of materials for industry and armament. It gives a comprehensive idea of the facilities, experience, and trained workers offered to expedite production for plants with prime and subcontracts. A double-spread shows some of the equipment made. *Brochure CEN.* L. O. KOVEN & BRO., INC., 154 Ogden Ave., Jersey City, N. J.

Extruded Plastic Shapes. An 8-page leaflet gives information and specifications

NOW AVAILABLE

CHEMICAL ABSTRACTS
Volumes I, II, and III

This printing was authorized by the American Chemical Society to fill the existing shortage of these volumes.

The original issues have been reproduced in facsimile by photography. The finished copies are reduced slightly in size to 5½ x 8½, are printed on slightly heavier paper, and are bound in light weight paper covers as were the originals, twenty-five issues per volume.

✦

Price per Volume (F. O. B. Ann Arbor, Michigan) . . $25.00.

EDWARDS BROTHERS, INC. *Lithoprinters*
ANN ARBOR *Established 1893* **MICHIGAN**

regarding extruded plastic shapes carried in stock. *Bile 55-C-12 CEN.* JULIUS BLUM & Co., INC., 532 West 22nd St., New York, N. Y.

High Vacuum Gages. This bulletin illustrates improved gages for use either as portable instruments or on a fixed mounting. It also explains how these gages are used to check a vacuum system at various points in order to determine whether there is any fall in pressure, whether the pipe lines are of adequate size or may have leaks, whether pumps are drawing the desired vacuum, how the efficiency of pumps or vacuum equipment compares, etc. The ease and quickness of readings around the plant and illustrations of the units themselves are also described. *Bulletin 42-G CEN.* F. J. STOKES MACHINE Co., Olney P. O., Philadelphia, Penna.

Laminated Solenoids. This is the title of a bulletin describing two new units of the pull and push-pull type. Particularly designed for specification by engineer-designers for hydraulic valves and general industrial purposes, maximum magnetic force for given electrical input is effected by design, laminated frame and plunger, and other features. Coils may be paper-section wound, or cloth-taped and treated. *Bulletin CEN.* DEAN W. DAVIS & Co., INC., 549 West Fulton St., Chicago, Ill.

"Mercuryless" Manometer. This bulletin describes a new aneroid flowmeter and liquid level manometer for handling highly volatile and corrosive liquids such as butadiene, styrene, alcohol, and acids. A torque tube is used in place of a stuffing box, thus eliminating troublesome leakage and need for lubrication and cutting maintenance cost to a minimum. Details on the application and operation of this unit are fully described. *Bulletin 98160 CEN.* TAYLOR INSTRUMENT Cos. Rochester, N. Y.

Micromax Resistance Thermometers. This 45-page catalog describes how operators of air-conditioning systems, chemical processes, refrigerating systems, oil refineries, etc., are able to see the small differences between temperatures at related points in their processes. It describes how a method for measuring laboratory temperatures at highest known precision has been opened up for plant work by the development of rugged Thermohm temperature detectors and machine-like Micromax measuring instruments. *Catalog N-33C CEN.* THE LEEDS & NORTHRUP Co., 4934 Stenton Ave., Philadelphia, Penna.

Motorelay. A bulletin and catalog on this unit for use with any floating contact device in applications where the control current exceeds the contact rating of the control instrument completely describe this unit, with photographs. *Bulletin A-20 or Catalog F-1753 CEN.* BARBER-COLMAN Co., Rockford, Ill.

Oil Fuse Cut-out Assemblies. This pamphlet describes a new line of metal-enclosed units, type D & W, particularly adapted for industrial plants (indoors or outdoors) to provide economical short-circuit protection and switching of feeder and branch circuits, individual transformers or banks, motors and control apparatus, electric-heating, and other types of equipment. They can be supplied with openings for conduit, cable, or pod-head connections. *Pamphlet 5254 CEN.* GENERAL ELECTRIC Co., Schenectady, N. Y.

Petroleum Naphthas. A 4-page leaflet on industrial petroleum naphthas includes a chart of evaporation rates of various solvents and Amsco petroleum solvents. *Leaflet CEN.* AMERICAN MINERAL SPIRITS Co., 230 North Michigan Ave., Chicago, Ill.

Precision Control. Under the title "Technique of Precision Control in Industrial Processes" this 64-page booklet presents applications of automatic control to industrial processes. The text is divided into chapters featuring precision measurement, fundamentals of control, types of controls, control valves, and typical applications. The illustrations are taken from current practice in varied industries and include schematic diagrams of basic control systems and illustrations of control apparatus. *Booklet 80-1 CEN.* BROWN INSTRUMENT Co., Wayne & Roberts Aves., Philadelphia, Penna.

Pumps. A 12-page illustrated bulletin, "Pacific Keeps Pace with Industrial Progress", tells the story of the company's part in the pump industry. *Bulletin CEN.* PACIFIC PUMP WORKS, Huntington Park, Calif.

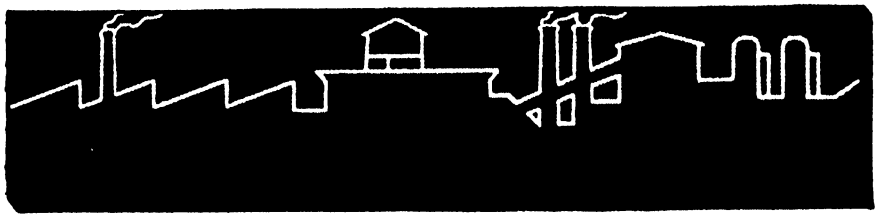
ANNOUNCING PUBLICATION

of **BEILSTEIN'S *Handbook of Organic Chemistry, 4th Edition***

(complete Hauptwerk with indexes, first Supplement, and Volume I of the second supplement—as issued by the German Chemical Society).



A very limited edition of these books is being photographically reproduced by authority of the Alien Property Custodian.

Printing will start November 16, 1942, and the entire set (59 volumes—49 books, totalling approximately 40,000 pages) will be completed by February 9, 1943.

The paper used will be heavier than that of the original publication, the page size will be identical to that of the original, and the binding will be Library Buckram superior to that of the original books.

Complete sets (F. O. B. Ann Arbor, Michigan) $400.00
Single Books (F. O. B. Ann Arbor, Michigan) ..... $ 12.50
(A 2% discount may be taken if remittance accompanies your order.)

EDWARDS BROTHERS, INC., *Lithoprinters*
ANN ARBOR ***Established 1893*** **MICHIGAN**

Control of Air Temperature and Movement

THE importance of precise control of air temperature and air movement in photographic research and developing was emphasized when discussions of air distribution in the projected Photo Laboratory of the U. S. Naval Air Station at Anacostia, D. C., began.

Eastman Kodak engineers and Charles Leopold, who acted in an advisory capacity, conducted exhaustive tests with high velocity, ceiling type, air diffusers. Their selection based upon the result of these tests was the Kno-Draft air diffuser manufactured by the W. B. Connor Engineering Corp., New York, N. Y.

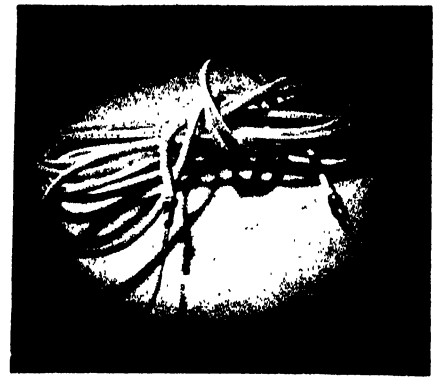
The importance of air to photographic chemistry was further demonstrated when adsorbers filled with highly activated coconut shell carbon, were installed at a du Pont film plant in New Jersey. This was done when slight traces of gases, originating in a refinery miles away, were found potent enough to result in batches of substandard film. The adsorbers eliminated this condition completely.

Nylon Tapered Paint Brush Bristles

TO SYNTHESIZE a paint brush material with the taper, resiliency, and toughness of natural bristle has been a goal of chemists for a quarter of a century. It became a national necessity to achieve that goal quickly after Pearl Harbor, for virtually all bristle had been imported from China and Russia.

Nylon paint brush bristles not only have the required taper but also resiliency, toughness, length, and inertness to paint ingredients. Moreover, they wear at least three times longer than natural bristles. The achievement of this tapered synthetic culminates five years of intensive research in du Pont laboratories.

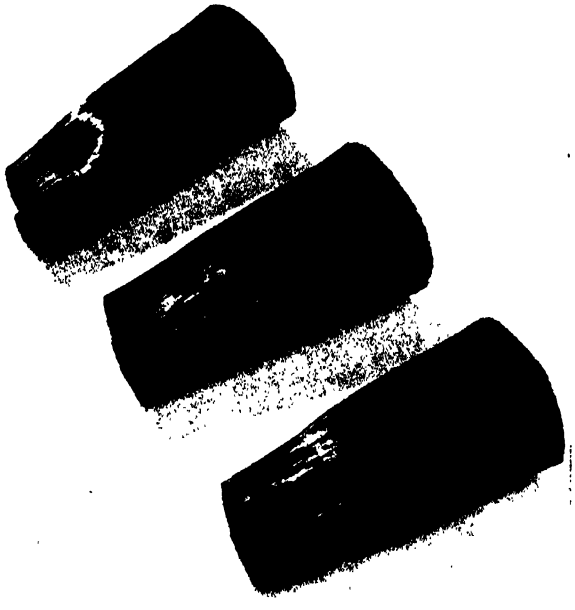
Today the Government is preempting for military uses the entire output of a busy pilot-scale plant. Early next year two full-scale units are expected to be in production, but their entire output will be required by the military. Nylon paint brushes for civilian use must await the end of the war.



An effort is being made to develop natural bristle production in the United States, but domestic pigs do not yield long, quality bristles for paint brushes. Some few thousand pounds of bristle can be had from South America. They are too short for large paint brushes and not nearly equal in quality to those of the Orient. Manufacturers tried to use other materials—vegetable fibers, horsehair, and the like—but with limited success.

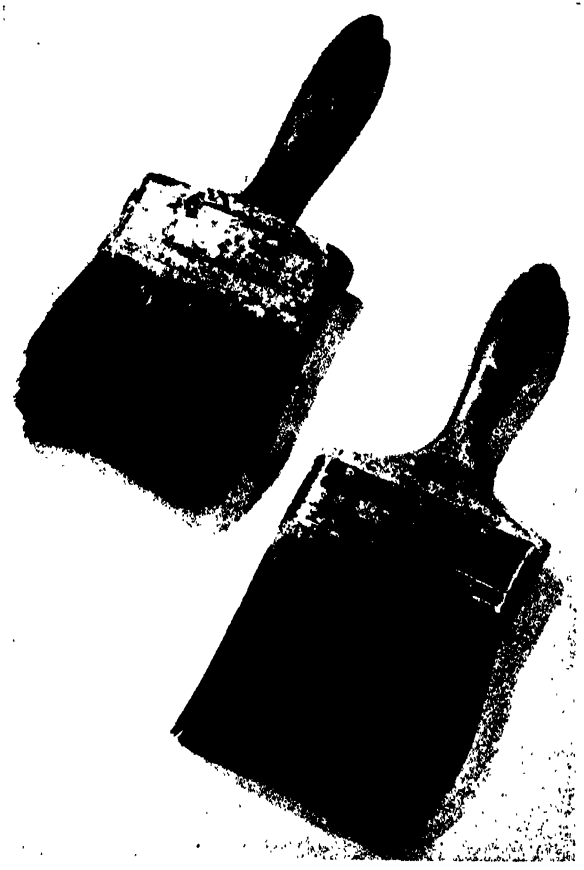
It was a comparatively easy job to spin a level filament of tough, resilient nylon. To spin a tapered filament was something else. Finally a taper was achieved by pulling a continuous nylon filament from a special spinneret at a controlled variable speed. That is, the size of the filament varies with the speed of pulling—thick diameters resulting at slow speeds, and thin diameters at fast.

Nylon filaments after being spun have to be drawn to several times their original length; that gives them their strength and resiliency.



Means of conditioning the filaments so they would not curl, and of automatically cutting them to ordered size, had to be figured out before a plant could start operating.

Glass-Insulated Flexible Heating Element



AVAILABLE in any length, a low-power flexible heating element now finds many uses, particularly in very limited space. Known as the Glasohm, and also widely used as a flexible power resistor, this prod-

CONTINUED ON PAGE 1551

Good paint brush bristles must be tapered, tough, and resilient. These new tapered nylon paint brush bristles in the bundles are superior replacements for long, lithe pig bristles which formerly came from China and Russia.

The paint brush with natural bristle, left, and the one with new tapered nylon bristle, right, have been used the same length of time. The natural bristle brush is virtually worn out, while the tough, resilient nylon bristle brush shows very little wear, and will last three times longer.

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ⟶ Display, $10.00 per column inch. 2 inches maximum, larger units at regular display unit rates. No discounts or allowances.
SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 5th and 20th, closing dates for editions of CHEMICAL and ENGINEERING NEWS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete. EMPLOYERS are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

UNEMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 announcements free (one per issue) set in standard style and limited to 50 words each, including 8-word box address, and 3 additional standard announcements at 50% of regular rate. Further announcements and excess words at full rate.

EMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

EMPLOYERS seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contracts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemist's Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 505 N. Michigan Avenue, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

GRADUATE FELLOWSHIP at $720–840 per year and Technical assistant at $1200 per year at Medical School for investigations in endocrinology, enzymes and metabolism.
Box 10-N-11, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST—A large paper manufacturer located near Philadelphia has a splendid opportunity for a graduate chemist or chemical engineer in its research department. Education, past experience, training and the ability to see a project through are major qualifications. As this is a permanent position we are interested in age, marital and selective service status. Reply by letter only giving full details with salary requirements and recent snapshot. Replies will be kept in strictest confidence.
Box 13-NP-11, Ind. & Eng. Chem., Easton, Pa.

CHEMIST WITH some petroleum experience. Needed in Chicago area for development of petroleum products and rust preventives. State age, draft status, degree, and salary desired in opening letter.
Box 18-NP-11, Ind. & Eng. Chem., Easton, Pa.

LABORATORY ASSISTANT for organic research laboratory in New York City. B.S. in chemistry or equivalent required. State in detail experience, references, age, date when available and send inexpensive photograph.
Box 21-NP-11, Ind. & Eng. Chem., Easton, Pa.

WANTED: for organic research laboratory in New York City. Experienced organic research chemist, Ph.D., with several years' experience in organic synthesis, preferably dyestuffs or pharmaceuticals. State age, academic, professional and draft data, when available, salary expected.
Box 22-NP-11, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST WANTED—Instructorship or Assistant Professorship in Southern Medical School for the duration. Give details concerning training, experience, personal history, references, and date of availability.
Box 42-N-11, Ind. & Eng. Chem., Easton, Pa.

GRADUATE ASSISTANTS—For semester beginning February first—Fifty dollars per month with free tuition and fees—Stipend increases annually—Minimal requirements: inorganic, analytical, organic, physical chemistry, calculus and one year of college physics—B.S. or M.S. degree—Submit small photograph and official transcripts of college courses—If satisfactory, application blank will be sent—Department of Chemistry, University of Pittsburgh, Pittsburgh, Pa.

AN ENGINEERING Construction Company, with long experience in Spanish America, is starting an Export Department and needs an experienced Chemical Engineer familiar with the design and operation of heavy chemical plants, particularly caustic soda and cyanide. Headquarters in New York City and to also spend considerable time in South America. Most advisable that he speak Spanish.
Box 55-NP-11, Ind. & Eng. Chem., Easton, Pa.

WANTED: Junior Analyst, Woman. College Graduate preferably trained in chemistry and pharmacy. Location metropolitan area.
Box 71-NP-11, Ind. & Eng. Chem., Easton, Pa.

FOOD TECHNOLOGIST—Applications will be welcomed from men with outstanding records to serve as junior chemists in eastern research laboratories, engaged in essential work. Prospects for advancement excellent for men of right qualifications. Please submit record of training and experience, personal history and recent photo.
Box 10-TP-11, Ind. & Eng. Chem., Easton, Pa.

CHEMISTS

with Bachelor or Master degrees for positions in laboratories of Analytical Chemistry, Biochemistry, Organic Chemistry and Physical Chemistry in eastern organisation engaged in essential activities. Opportunities for qualified men. Submit details concerning training, experience, personal history, and small photo.
Box 12-TP-11, Ind. & Eng. Chem., Easton, Pa.

EXPERIENCED CHEMICAL ENGINEER

Excellent opportunity for man of outstanding qualifications in research laboratories located in the East, occupied with essential activities. Please submit college record, experience, accomplishments, and small photo.
Box 11-TP-11, Ind. & Eng. Chem., Easton, Pa.

A LARGE EASTERN manufacturer of white and colored pigments has a permanent position for an experienced paint chemist on the staff of its Technical Service Laboratory. In reply give complete data regarding education, experience, draft status, salary desired, and other pertinent facts. Enclose photograph.
Box 14-T-11, Ind. & Eng. Chem., Easton, Pa.

CHEMIST—For Technical Sales Work. Capable man with experience in field of coatings, adhesives, synthetic resins. Chemical engineer preferred. Must be able to understand new processes quickly, make plant demonstrations. About half of time to be spent in field. Give full particulars, inexpensive photograph, salary expected in application. Eastern manufacturer.
Box 15-TP-11, Ind. & Eng. Chem., Easton, Pa.

NEW RESEARCH fellowship available at once on production of new synthetic fiber. Fifteen hours' course work can be taken per year toward Ph.D. Stipend $70 per month for 11 months. Applicants should have M.S. or equivalent. Preference will be given to candidates not eligible under selective service because of physical disabilities, sex, or other reasons.
Box 23-T-11, Ind. & Eng. Chem., Easton, Pa.

WANTED IMMEDIATELY Chemist with good knowledge of essential oils and flavoring materials; must be very practical man; take charge management of manufacturing and analytical department of progressive essential oil firm, New York City. State in first letter qualifications, salary, draft status; enclose recent photograph.
Box 24-T-11, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 1550)

FOOD TECHNOLOGIST

(MAN OR WOMAN)
Permanent Position with Security and Future

Graduate in chemistry preferred, for service laboratory and food kitchen, with New York company manufacturing food starches, specializing in products supplied to bakers and manufacturers of salad dressings, soups, confections, puddings, and miscellaneous food products.

Work includes adaptation of new products to commercial uses, development of formulas and recipes, and preparation of technical sales information.

Submit complete record of training, education, and positions held. Enclose recent photo, not returnable unless requested.

48-TP-11, Ind. & Eng. Chem., Easton, Pa.

WANTED TO BUY

Used porcelain-lined, 33-pound capacity, preferably motor driven Ball Mill; laboratory Turret Bowl Classifier, 3′-0″ bowl diameter preferred; Bowl Thickener; Blunging Tanks, 5 cubic feet capacity. Equipment must be in good working condition.

Box 13-T-11, Ind. & Eng. Chem., Easton, Pa.

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised, or in regard to those seeking employment.

(Situations Open Continued)

LACQUER CHEMIST with several years' experience in lacquer formulation or application for development work on protective coatings applied to metals. Eastern Pennsylvania location. In reply, state salary desired, draft status, etc.
Box 32-TP-11, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST with library training to care for chemical and pharmacological library and do literature searching and abstracting. Knowledge of German and typing necessary. Give educational background and experience. New York State location.
Box 38-T-11, Ind. & Eng. Chem., Easton, Pa.

FIRE PROTECTION Engineer and Inspector. Permanent positions open in New York, Pennsylvania, or the Middle West with large industrial fire insurance organization. Previous knowledge in this work not necessary. Applicant must be a technical graduate with manufacturing or engineering experience, and possess a good personality. Several months' training with full pay will be given Send photo with letter.
45-T-11, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL AND ORGANIC Chemists: Large Ohio manufacturer interested in securing services of first class organic chemist with Ph.D. degree. This is not a duration job, and we are interested only in men who have personality to work with others on major chemical problems. We can also use an analytical chemist for regular laboratory work. Salary open.
57-TP-11, Ind. & Eng. Chem., Easton, Pa.

RESEARCH LIBRARIAN, female, Ph.D., well trained in organic and physical chemistry, good reading knowledge of German and French, capable of thoroughly searching literature and writing clear reports.
70-TP-11, Ind. & Eng. Chem., Easton, Pa.

WANTED: Chemical technician, preferably college trained. Opportunity for graduate study.
71-T-11, Ind. & Eng. Chem., Easton, Pa.

CHEMIST WANTED for development and production work in chemical pigments. Permanent position for man with ability and initiative. Only men in 3-A draft classification need apply.
76-T-11, Ind. & Eng. Chem., Easton, Pa.

GOOD OPENING for Research Chemist to improve present products and lead old established manufacturing concern into new fields. Graduate organic chemist with research experience in organics and with proven creative ability desired. Give full particulars of education, experience and accomplishments.
77-TP-11, Ind. & Eng. Chem., Easton, Pa.

AMERICAN WOMAN Chemist wanted for abstracting and literature work in organic and biochemistry; should be able to type. Excellent library facilities, New York area. Give full particulars.
81-TP-11, Ind. & Eng. Chem., Easton, Pa.

WOMAN TECHNICIAN for laboratory engaged in routine feed analysis and applied research for a large New England Feed Manufacturing Concern. An opportunity to become familiar with vitamin assay technique. Location—Greater Boston. Wanted immediately. Give full particulars in first letter, including minimum salary, experience, and a recent photograph.
Box 80-T-11, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(A.C.S. MEMBERS)

SYNTHETIC ORGANIC chemist. M.S. research and development experience in plastics. Desires organic research position (plastics or other industry) contributing directly to war effort. Young, married, responsible. Presently employed. Metropolitan location preferred.
Box 36-N-10, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, available for spare time work. Broad training and experience, including catalysis, petroleum and fuels technology, explosion processing, pharmaceutical synthesis, metallurgical chemistry. Specialist in new process development and plant design. Currently employed, with contract permitting outside work of practically unlimited scope. Central eastern U. S. war work only.
Box 63-N-10, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST—Ph.D. February 1943 from an eastern university. Well grounded in organic synthesis. Single, 24, 2-A in draft. Physical chemistry minor. Eastern location preferred.
Box 15-T-10, Ind. & Eng. Chem., Easton, Pa.

RESEARCH DIRECTOR, Ph.D., assistant at two world renowned universities. 12 years' research experience in organic synthesis and biochemistry (hypnotics, analeptics, vasoconstrictors, antiseptics, vitamins, hormones). 5 years' research director of French industrial laboratory, one year research director of American industrial laboratory. Desires similar position in large industrial research laboratory or university. Age 36, first citizenship papers, draft status 2-B.
Box 31-T-10, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, M.A. 1939. Two years with major petroleum corporation and one with well-known research institute. Most of course work for doctorate at large mid-western university. Thermodynamics, colloid chemistry, electrochemistry, advanced organic, physics, mathematics. Research. Sigma Pi Sigma. Read German, French, Russian. Age 28, married, draft deferred.
Box 45-T-10, Ind. & Eng. Chem., Easton, Pa.

BIO-ORGANIC CHEMIST Ph.D. May, 1942. Research experience in organic, enzyme, vitamin (pyridoxine and pantothenic acid) chemistry. Formerly employed on vast industrial vitamin project. Papers being published. Member Phi Beta Kappa, Phi Lambda Upsilon, Sigma Xi. Interested in research vital to war effort in above fields. East only.
Box 53-T-10, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER and chemist 20 years' experience in research, process development and production of chemicals, design of chemical equipment, seeks responsible position where services will contribute more to the winning of the war. Qualified to undertake technical investigations; sound business judgment and administrative ability; expert knowledge of oils, fats and their derivatives, glycerine and other chemicals. Good character, sound health, married, Protestant, American citizen with draft status 3-B.
Box 46-N-11, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B.S. (Ch.E.) 3½ years' experience in photographic chemicals, photography, and salesmanship. 22 years old, single, draft status 2-A. Not particular what field of Chemical Engineering work is in. Available after Dec. 1, 1942.
Box 59-N-11, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST—13 years' experience as supervisor in analytical laboratory of large rayon plant. Employed at present. Married, one child, age 39, draft 3-A. Desire permanent position with greater chance for advancement than present position.
Box 60-N-11, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST Ph.D. 25 years' experience synthetic organic chemistry, process development, plant management, research direction, plant design, experienced in synthetic chemicals, plastics, protective coatings. Capable of directing plant producing organic substances or taking charge of research program.
Box 17-T-11, Ind. & Eng. Chem., Easton, Pa.

SALES DEVELOPMENT & Research Engineer. Ph.D. in Chemistry; 15 years' experience in Rubber and allied chemical products development; U. S. citizen; married; age 46; draft exempt; thoroughly familiar with recent developments in synthetics and government activities. Available on sixty days' notice.
Box 18-T-11, Ind. & Eng. Chem., Easton, Pa.

TECHNICAL PRODUCTS research and development chemist. Wide experience in the development and production of corrosion preventive compounds, low temperature lubricants, gear lubricants, and petroleum specialties. Capable of assuming charge of product research and production in these and allied fields. Age 39. Now employed but would like to relocate in the Central Texas area.
Box 19-T-11, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D. Seven years' Industrial research with starch and starch products, 3 years' teaching experience. Thorough training in colloid chemistry and bacteriology. Capable of working independently or directing work. Employed. Married, age 34, Class 3A. Academic position or Industrial research desired.
Box 20-T-11, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 1941, now employed but desires advantageous change. Experienced in basic organic, especially pharmaceutical, dyestuffs, and photographic chemistry. Industrial or academic position considered.
Box 25-T-11, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST with minor in organic chemistry, M.S. 1937. Five years' experience in laboratory and production work, three and half of which were in petroleum and related industry. Now engaged in engineering work and desire change. Prefer production work or research work. Excellent references. Age 29. Married. No children.
Box 27-T-11, Ind. & Eng Chem., Easton, Pa.

RUBBER TECHNOLOGIST, (Ch.E.). Six years' laboratory and plant experience. Specialist on compounding and processing of Buna-S and Butyl, thorough knowledge of all synthetics. Married, age 30, two dependents, draft 3-B. Imaginative, inventive, mechanically inclined.
Box 28-T-11, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. (1941), minor in biochemistry. Six years' experience including one year on post-doctorate fellowship. Research on sterols, alkyl-aromatics and pharmaceuticals. Extensive training in analytical and biochemistry. Nine publications. Desires position in research, teaching or research and development. Age 26. Single. Sigma Xi and Phi Lambda Upsilon.
Box 29-T-11, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. Thoroughly experienced planning and supervising research, process development and production on drug and chemical specialties. Understand fully coordination of laboratory and plant problems. Excellent reputation; publications; patents. Employed. 47 years old. Minimum salary $6000.
Box 33-T-11, Ind. & Eng. Chem., Easton, Pa.

VAPOR PHASE catalytic chemist and chemical engineer with ten years' experience, mostly in research and development work with a little plant control. Also some general organic and inorganic experience. Location immaterial. Available immediately.
Box 36-T-11, Ind. & Eng. Chem., Easton, Pa.

TRANSLATIONS, TYPING. Woman Chemist: Many years' experience in Industrial chemistry, a well qualified Russian translator and an expert typist, desires translations and/or typing which can be done at home.
Box 37-T-11, Ind. & Eng. Chem., Easton, Pa.

BACTERIOLOGIST, CHEMICAL Engineer first papers, age 45. Married, one child, 3A. 20 years Industrial experience as bacteriologist and plant manager in fermentation—food and chemical industries, laboratory experience, available short notice. Replies.
Box 39-T-11, Ind. & Eng. Chem., Easton, Pa.

RESEARCH AND DEVELOPMENT Chemist, Ph.D. At present in charge of production, control and inspection laboratory but would like change. Three years' research in Physical Chemistry. 1½ years' as supervisor in explosives. Familiar with government specification work, Prefer war research work. Married, Draft 3-A. Sigma Xi, Publications.
Box 42-T-11, Ind. & Eng. Chem., Easton, Pa.

EXECUTIVE CHEMIST, Ph.D. and LL.B. 16 years of diversified industrial experience. Consultant on chemical-legal problems such as chemical patents, infringement suits, contracts involving chemicals.
Box 43-T-11, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D. Desires research or teaching position. Author over fifty papers, chiefly enzymes, vitamins, clinical chemistry. Holder fellowships including Rockefeller. Immediately available. Age 34, American, married, draft 3B. Good references.
46-T-11, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST, Ph.D. Physical Chemistry. At present Chief Chemist of explosives inspection laboratory. 3 years' research on methods. Desire supervision work in defense plant. Married, Draft 3-A, publications, Sigma Xi.
Box 47-T-11, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER. Nine years' production supervisor in fine and organic chemicals; some heavy chemicals. Married, 35, draft 3-B.
49-T-11, Ind. & Eng. Chem., Easton, Pa.

ORGANIC-BIOCHEMIST, Ph.D., 1937, Age 29, Draft exempt. 3½ years' research midwestern medical school, vitamins and neuro-pharmacology. 1½ years' supervisory and research work explosives laboratory. Desire essential research or supervisory position in war industry. Release obtainable on two weeks' notice.
51-T-11, Ind. & Eng. Chem., Easton, Pa.

RUBBER AND PLASTICS Chemist, M.S. Fifteen years' research and development experience in rubber and associated industries. Experienced in field contacts, laboratory management. Physics and mathematics training. Age 42, with family. Place of responsibility desired.
52-T-11, Ind. & Eng. Chem., Easton, Pa.

PLANT SUPERINTENDENT: Chemical Engineer, five years' experience all phases of alcoholic fermentation and distillation; whiskey and alcohol; plant operation and laboratory control. Seeks position as superintendent of production in fermentation industry. Available reasonable notice. Native American, married, age 31, draft 3-A.
53-T-11, Ind. & Eng. Chem., Easton, Pa.

SPECTROSCOPIST—M.S. Experienced in spectrochemical analysis of inorganic chemicals for trace elements and applications in research, development, and control problems. Familiar with X-ray diffraction for identification purposes. Capable of setting up new laboratory and establishing analytical methods. Now employed as a spectroscopist in chemical plant but desire opening with less routine work. Married, 24, draft status 2-B, Methodist, location immaterial. Sigma Xi, Sigma Pi Sigma. Available on short notice.
54-T-11, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST—Eastern University. Ten years' diversified chemical experience in petroleum and rubber development and research. Thorough background and experience in organic synthesis, surface active agents and emulsifiers, emulsion polymerization and related work. Desires change to a position of greater responsibility and advancement. Available on reasonable notice. Married. Dependents, Draft 3-A.
55-T-11, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 1551)

(Situations Wanted Continued)

RESEARCH CHEMIST, M.S., six years' experience in coal research, several publications, capable of handling men, employed in large research institution. Desire position more closely connected with war work, salary $3600 up, prefer midwestern location. Draft 3-A, married, one child.
58-T-11, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, PHARMACEUTICAL, Phm.B. (pharmacy); B.Sc. and M.Sc. (Chemistry); wishes to change to progressive firm offering responsible position requiring a knowledge of pharmacy, pharmaceutical chemistry, manufacturing procedures and control, as well as ability to do investigating work with new products and with formula changes in existing products; administrative ability; two years' experience as chief chemist of small pharmaceutical house. Age 31, 2-A deferment, Canadian, first papers for U. S. citizenship, excellent references.
62-T-11, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, European training, 10 years' diversified industrial experience, inorganic, organic, now employed, desires position with better opportunities. Age 35, married with children; friendly alien, first papers. Eastern location preferred.
63-T-11, Ind. & Eng. Chem., Easton, Pa.

ESSENTIAL Employment desired by physical chemist Ph.D., 1941. Special training in colloidal and surface phenomena. Years' research and development experience in coatings, paper, proteins, adhesives. Sigma Xi, Phi Lambda Upsilon, six publications. Married, age 29, now employed.
65-T-11, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC RESIN Chemist, Ph.D. Six years' highly successful research and production of many types of resins, including Alkyds, High Polymers, Phenolics, etc. Excellent references. Resourceful and practical. Age 29, married.
66-T-11, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.S., 1941; Age 26. 2½ years' petroleum, two years' supervising large laboratory testing explosives. Desire essential research or supervisory position in war industry. Draft status 3-B; married, two dependents; Protestant. Release obtainable on two weeks' notice.
67-T-11, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER. (May 1942 B.S.). Wishes to be connected in active Defense work. Experience—one year in cellophane research and six months in petroleum refinery. Age 25, single, draft 2-A. Available immediately.
69-T-11, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER presently employed as Process Engineer in the design of an important war plant in the Far West will be free for new and similar employment about middle of January. Extensive experience in Petroleum Refining, age 31, single, 3-B, speak fluent Spanish. Prefer California, will consider Latin America.
72-T-11, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D. Eight years' wide research experience with large concern; food products, vitamin synthesis and assays, industrial fermentations. Publications, patents. Now employed, desires position progressive organization undertaking expansion of research or setting up new department. Age 34, married. Available, reasonable notice.
73-T-11, Ind. & Eng. Chem., Easton, Pa.

GRADUATE CHEMIST, M.S. Carnegie Tech. master mechanic desires position as research engineer. Twelve years' experience in textiles and resins, Mechanical design and construction. Married, four children, 3-B; salary must be sufficient to support family decently.
74-T-11, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, German Jewish, 31, single. Have first papers. M.S. Technical, University Berlin. Spectroscopic Defense Course, experienced in production of fertilizer, analysis of food and tuberculosis research. Speak, read, write English, German, French, Spanish. Now employed in Colorado. Will consider any offer. Good references.
78-T-11, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED (NONMEMBERS)

ADMINISTRATION: Graduate industrial chemist; thirty-nine, married; fifteen years' production, sales, management; costs, statistics, systems. Able organizer. Experienced writer and speaker. Desires post as executive or assistant in chemical industry. Salary $4000.
Box 21-T-11, Ind. & Eng. Chem., Easton, Pa.

CHEMIST: B.S.—A.C.S. accredited university. Good background in the four branches of chemistry, including explosives. One year experience with cement analytical chemistry, half year in laboratory of large eastern textile manufacturer. Employed, but desire position with company necessary to war, possessing post-war stability. Interested in development and/or research or job leading to same. East preferred.
Box 26-T-11, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ANALYST. Age 47. Twenty years' laboratory experience. I.C.S. graduate. Desires employment in Eastern or Central states for duration of war.
Box 30-T-11, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.A., 2 years' experience in commercial analytical control work. Desire to enter organic field. Single, age 37, 4F draft. Prefer to be located in Mountain or Pacific time belts.
Box 31-T-11, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST—Ph.D. from leading midwest university. Thirteen years' experience hormone research and teaching. Many publications. Capable investigator, alert constructive thinker, executive ability, agreeable personality and appearance. Member leading professional organizations. Employed (ninth year present position) but desire change to responsible research or teaching position not necessarily in endocrine field. Age 34, married, 2 children, U. S. Citizen, 3A.
Box 34-T-11, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, Inorganic, physical, colloid chem. Several years' experience. Patents. Friendly alien, first papers, wants permanent position for pilot plant development work or research, New York vicinity.
Box 40-T-11, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, Ph.D., 1942, Stanford University. Physical Chemistry major, mathematics minor. Desires research position. Available December 1, 1942. Location immaterial.
59 T 11, Ind. & Eng. Chem., Easton, Pa.

Industrial News

CONTINUED FROM PAGE 1548

uct is made by Clarostat Mfg. Co., Inc., 285-7 North 6th St., Brooklyn, N. Y.

The resistance wire is wound on a fiber-glass core and is protected by a fiber-glass braided covering. The unit can be readily bent and compacted to fit snugly about parts to be heated, or jammed into very tight spots, in either case providing an efficient heating means.

Anhydrous Sodium Metasilicate

THE manufacture of anhydrous sodium metasilicate at its Chester, Penna., and Anderson, Ind., plants has been announced by the Philadelphia Quartz Co., Philadelphia. This product is called "Metso anhydrous", latest member of their line of Metso cleaners. It is a technical grade of anhydrous sodium metasilicate without water of crystallization.

White and free-flowing, the anhydrous metasilicate is specially sized to reduce dustiness and to permit ready solubility.

Explosion-Proof Rotary Air Motors

ANNOUNCEMENT has been made by the Gast Mfg. Corp., Benton Harbor, Mich., that its rotary air motor is now available for new applications. This unit is especially suitable for locations where compressed air is available and where explosion-proof equipment is essential.

Extinguishing Alcohol Fires

Alcohol fire is burning in this test but flame is invisible to camera. Note no breakdown of foam in contact with burning alcohol.

This is the same fire, with flame visible due to a chemical coloring.

ALCOFOAM, a development of the American-LaFrance-Foamite Corp., Elmira, N. Y., forms a smothering blanket that snuffs out flames in alcohols, ketones, esters, ethers, and other flammable liquids. Poured into any single powder generator and carried through a water stream, Alcofoam powder generates a foam that floats on the lightest liquid surface, cutting off the supply of oxygen necessary to support combustion.

Protective Clothing for Women Welders

A COMPLETE line of tailored protective clothing for women welders, described as the first of its kind to be really styled according to accepted dressmaker patterns, is announced by American Optical Co., Southbridge, Mass. Made of specially selected chrome-tanned cowhide, the new clothing is light in weight, yet gives positive protection against dangerous flying sparks.

To protect hair and ears a special tailored cap is made of chrome-tanned leather, shaped somewhat like a bathing cap, with flaps extending over the ears.

Automatic Photoelectric CutOff

AN AUTOMATIC photoelectric cutoff has been developed for use on weighing machines, by the United Cinephone Corp., Torrington, Conn. Batch weighing, container filling, and other automatic weighing operations can be stepped up in speed and accuracy, and it can also be applied to measuring or indicating instruments.

THE Standard Oil Co. of New Jersey has purchased the one half interest of the National Distillers Corp. in the Standard Alcohol Co. This company was organized in 1932 jointly by Standard and National Distillers. The manufacturing plant is located at Linden, N. J., and another is under construction in the South.

BUSINESS OPPORTUNITIES • FOR SALE • WANTED • ETC.
MISCELLANEOUS

Five cents a word, minimum charge $2.00; display available at $7.50 per inch; in advance. No discounts or allowances

MICRO-ELEMENTARY ANALYSES: C, H, N, S, P, Halogens, Methoxyl, Mol. wt., etc., U.S.P. and other official tests, Purity tests, Microinorganic assays, Spot tests, Micro-distillations, Toxicological investigations, and typical micro-chemical research work. Dr. Carl Tiedcke, 366 Fifth Avenue, New York, N. Y.

WANTED: Journal of American Chemical Society, Vol. 1-25 inclusive or set of several volumes ending with Vol. 25.
Box 22-T-10, Ind. & Eng. Chem., Easton, Pa.

WANTED: Schwyzer, "Fabrikation der Technische und Pharmaceutisher Produkte." Want new or used copy.
Box 22-T-11, Ind. & Eng. Chem., Easton, Pa.

WANTED to BUY: Electric or Spring Drive Standard Kymograph and Drum. Approximate speeds preferred—one revolution per hour and one revolution per five or six hours.
Box 35-T-11, Ind. & Eng. Chem., Easton, Pa.

FOR SALE in part or whole, 1.5 kg. Melibiose (Hydrate), $(\alpha)_D^{20} = +129.5°$. Inquires for other sugars invited. Louis J. Cracas, Oradell, New Jersey.

FOR SALE: Following volumes inclusive: Chemical Abstracts, 23 to 30; Industrial Engineering Chemistry, 20 to 32; Analytical Edition, 1 to 12. Unbound, little used. Located Staten Island, N. Y. Will Ship C. O. D. for any reasonable sum.
44-T-11, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: British Chemical Abstracts, 1926-1940, index 1923-1932. Bound, Chemie et Industrie, 1918-1934, Bound. Color Trade Journal, 1-7, Bound. Metal and Alloys, 1-9, Bound. American Society for Heating & Ventilating, Vol. 3-14, 24-36. Friedlander Fortschritte der Teerfabrikationen, Band 1-12. Only the Pharmaceutical chapters bound. Any reasonable offer accepted.
50-T-11, Ind. & Eng. Chem., Easton, Pa.

WANTED: Helvetica Chimica Acta, v. 1-12, Journal Praktische Chemie, 1-124, Chemisches Zentrallblatt v. 1-59, Journal Chemical Society, v. 1-20, Chemical Industries, v. 1-24, ASTM. Bulletin Nos. 1-19, Recueil Travaux Chimiques des Pays-Bas, v. 1-33, Proceedings Royal Society of London, v. 1-34, Proceedings Society Experimental Biology and Medecine, v. 1-7, Journal Textile Institute, v. 1-11, Zeitschrift Anorganische Chemise, v. 6-47. Please state condition and price.
60-T-11, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Industrial & Engineering Chemistry, Complete (32 Vols.); Chemical & Engineering News Edition, Complete; Industrial & Engineering Chemistry, Analytical Edition, Complete (11 Vols.); Chemical Abstracts, Complete (113 Vols.); Journal American Chemical Society, Vol. 24-63 (81 Vols.); Journal Society Chemical Industry, Vol. 2-60 (60 Vols.); Chemistry & Industry Review, Complete (18 Vols.); British Chemical Abstracts 1926-1940 (18 Vols.); International Sugar Journal, Vol. 5-43 (37 Vols.); All above (except year 1941) handsomely and durably bound in ¾ leather, and in perfect condition. Year 1941 unbound. Make offer. F. Gay, 825 West 179th St., N. Y. C.

FOR SALE: National Geographic Magazines, 1916-1941 inclusive, unbound, complete, fine condition, $60. Also, any other issue of the Geographic, 1888-1942. Reader's Digests 1930-1941 inclusive, $18.00; Fortune, 1930-1941 inclusive, $90; Time, Life, Scientific Periodicals, chemical, medical, physical, send want list, no obligation.
Periodical Service, Box 327, Swarthmore, Pa.

FOR SALE: 40 pounds Tellurous Acid CP, 100 pounds Boron Trichloride, Galacturonic and Levulinic Acid, Digitonin, Tryptophane, Histamine & Histidine Salts, d-Ribose, All Caesium and Rubidium Salts, All Cacodylates, 100 pounds Scrap Sheet Molybdenum, 10 pounds Gem Topaz uncut.
Box 82-T-11, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Typewritten abstracts of United States patents on the manufacture of Synthetic Rubbers and Elastoplastics, the latter including plastics with rubbery properties. Also intermediates used in the manufacture of the above products, together with such allied products as chlorinated rubber, rubber hydrochloride, isomerised rubber, rubber derivatives, polymerization products, especially of the olefins and diolefins & etc. These abstracts have been made by a rubber chemist from a chemical viewpoint, and contain ten to five hundred words each. The period covered is from 1909 through 1930, and contain over five hundred patents. The period will be completed through 1942 if the demand warrants it. Index lists have been prepared and arranged in numerical order & etc., containing assignees, assignors, as well as a briefed statement of the subject of each. Legitimate inquiries solicited.
64-T-11, Ind. & Eng. Chem., Easton, Pa.

NEED EQUIPMENT? Then contact The Laboratory Exchange at New York. Write, wire or phone whatever your needs are in laboratory equipment. Your inquiry will receive immediate attention. We have served American chemistry for ten years with fine used guaranteed equipment. Reasonably priced. The Laboratory Exchange, 24 E. 21st St., New York City.

WANTED: Chemical Abstracts, Journal American Chemical Society, Berichte Chemische Gesellschaft, Biochemical Journal, Helvetica Chimica Acta, Beilstein Handbuch, Journal Praktische Chemie, International Critical Tables complete sets or parts.
75-T-11, Ind. & Eng. Chem., Easton, Pa.

WANTED: Chemical Abstracts 1936 to 1941 part or entire lot. Give price.
79-T-11, Ind. & Eng. Chem., Easton, Pa.

WANTED: Any salts of Dysprosium, Erbium, Hafnium, Gadolinium, Rhenium, Scandium, Terbium, Thallium; Boron Amorphous, Quartz Crystals, Iceland, Spar Crystals, Pollucite Mineral, Thortveitite Mineral, Scheelite, Carnotite, Tantalite.
Box 83-T-11, Ind. & Eng. Chem., Easton, Pa.

Respirators. This bulletin describes the Comfo Dust respirator which, in order to save metal, has been redesigned with filter cases of plastic. Better appearance plus less resistance to air flow are two of the advantages. The new filter container units are thinner, with rounded edges, permitting better sidewise and downward vision. The plastic used has high impact strength with no electrical conductivity and is not affected by perspiration. *Bulletin CR-9 CEN.* MINE SAFETY APPLIANCES Co., Braddock, Thomas, & Meade Sts., Pittsburgh, Penna.

Temperature Indicators. A pencil-type indicator of temperatures, called "Tempilstiks" is described, for low-temperature work, where a Seger pyrometric cone cannot be employed. With a range of from 125° F. to 700° F., these units are used for preventing cracks during metal processing, indicating the approach of safe temperature limits in the manufacture of costly castings, checking bearing, motor and insulation temperatures. Color identifies each temperature range, the pencil-like marking melting when the correct temperature is reached. They are accurate to within 1 per cent of the stated value. *The Laboratory, Vol. 13, No. 4 CEN.* FISHER SCIENTIFIC Co., Pittsburgh, Penna., and EIMER & AMEND New York, N. Y.

CHEMICAL AND ENGINEERING NEWS

HARRISON E. HOWE, Editor

PUBLISHED BY THE AMERICAN CHEMICAL SOCIETY

VOLUME 20 DECEMBER 10, 1942 NUMBER 23

9th Annual Chemical Engineering Symposium

Division of Industrial and Engineering Chemistry, A. C. S.

Palmer House, Chicago, Ill., December 28 and 29, 1942

THE Ninth Annual Chemical Engineering Symposium of the Division of Industrial and Engineering Chemistry, AMERICAN CHEMICAL SOCIETY, will be held Monday and Tuesday, December 28 and 29, 1942, at the Palmer House, Chicago, Ill.

This Symposium on Industrial Reaction Rates is intended to deal primarily with the applications of chemical kinetics combined with transfer rates to the rational design of process equipment and the calculation of schedules of operation. Great strides have been made in the theoretical aspects of chemical kinetics through the media of statistical mechanics, but relatively little literature is available on the translation of such information into the terminology of the chemical engineer.

Registration. All persons attending the meeting must register. The registration fee is $1.00 for members of the AMERICAN CHEMICAL SOCIETY, students, and nonchemist visitors, and $2.00 for chemists and chemical engineers who are not members of the SOCIETY. Registration will be in the foyer of the fourth floor of the Palmer House.

Officers

R. N. Shreve, Purdue University, Chairman.
T. H. Chilton, E. I. du Pont de Nemours & Co., Inc., Vice Chairman.
Whitney Weinrich, Gulf Research & Development Co., Secretary-Treasurer.

Executive Committee

L. W. Bass, New England Industrial Research Foundation.
F. J. Curtis, Monsanto Chemical Co.
C. C. Furnas, Yale University.
H. E. Howe, Editor, *Industrial and Engineering Chemistry.*
H. F. Johnstone, University of Illinois.
T. K. Sherwood, Massachusetts Institute of Technology.
T. B. Drew, Columbia University.
P. D. V. Manning, International Minerals & Chemicals Corp.
K. M. Watson, University of Wisconsin.
O. A. Hougen, Chairman, University of Wisconsin.

Program of Papers. All papers will be presented in Room 17 of the Palmer House. Each paper is allotted 30 minutes for presentation followed by 15 minutes for discussion.

Local Committee

Harry McCormack, Chairman, Illinois Institute of Technology.
K. M. Watson.
R. J. Altpeter.
R. C. Kintner.
C. A. Herbst.

Symposium Committee

E. W. Comings, University of Illinois.
C. M. Cooper, E. I. du Pont de Nemours & Co., Inc.

Nominees for Offices in the A. C. S.

THE following members of the AMERICAN CHEMICAL SOCIETY have been nominated for the offices indicated, and balloting is now in progress:

President-Elect. T. A. Boyd, C. S. Marvel, Thomas Midgley, Jr., Linus Pauling, W. T. Read, E. H. Volwiler, Hobart H. Willard, Robert R. Williams; *Councilors-at-Large.* M. L. Crossley, Vincent du Vigneaud, George Glockler, W. N. Jones, O. E. May, W. Albert Noyes, Jr., George Scatchard, R. L. Shriner, Robert B. Sosman.

The committee which counted the vote for nominations consisted of H. L. Haller, Raymond M. Hann, W. Gordon Rose, E. R. Smith, and Charles L. Parsons.

Ballots must be received in the office of the Secretary of the SOCIETY on or before December 15, 1942.

Monday, December 28

Morning Session

E. W. COMINGS, *Chairman*

8:00 to 10:00 A. M.—Registration.
10:00 A.M.—HENRY EYRING, H. M. HULBERT, AND R. A. HARMAN. Theory of Absolute Reaction Rates.
11:00 A. M.—W. S. BONNELL AND WHITNEY WEINRICH. Isomerization of Normal Butane.

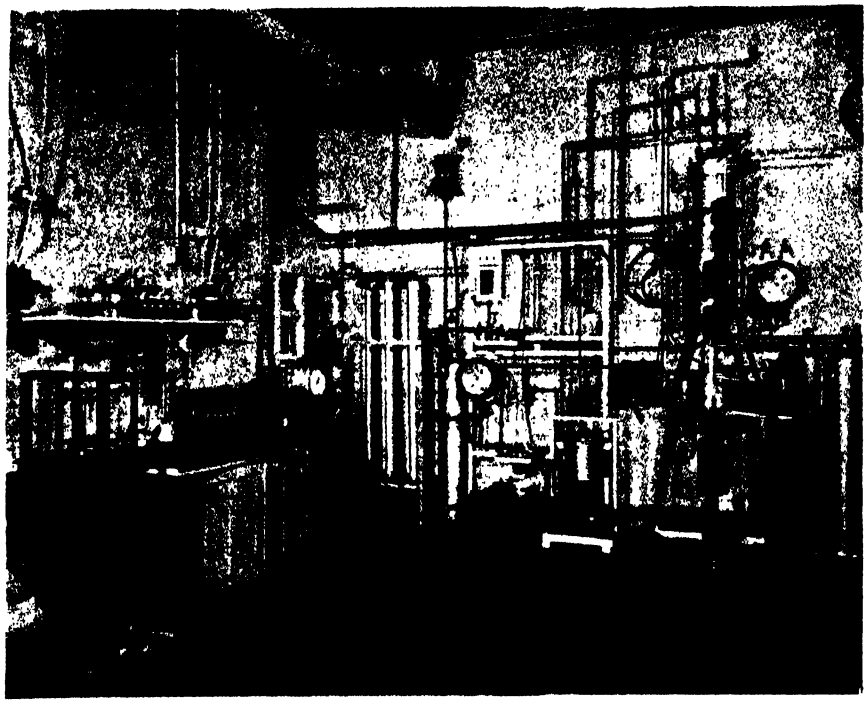
Afternoon Session

P. D. V. MANNING, *Chairman*

2:30 P. M.—P. H. EMMETT. Rate of Ammonia Synthesis.
3:15 P. M.—C. W. DEANE. Kinetics in Acid Media.
4:00 P. M.—H. F. HOERIG, DON HANSON, AND O. L. KOWALKE. Rates of Vapor Phase Esterification.

Evening

7:00 P. M.—Dinner, Room 17, Palmer House.



HARRY MCCORMACK, *Toastmaster*

Tuesday, December 29

Morning Session

C. M. COOPER, *Chairman*

9:00 A. M.—FARRINGTON DANIELS. Prediction of Reaction Rates.

Equipment for studying reaction rates, Chemical Engineering Dept., University of Wisconsin

9:45 A. M.—D. M. HURT. Principles of Reactor Design.

10:30 A. M.—C. C. DEWITT. Correlation of Rate Data.

11:15 A. M.—K. M. WATSON. Rate Equation for Heterogeneous Catalysis.

Afternoon Session

T. B. DREW, *Chairman*

2:00 P. M.—R. H. WILHELM, W. C. JOHNSON, F. S. ACTON, AND J. A. CAWLEY. Transverse Heat Transfer in Catalyst Beds.

2:45 P. M.—Rates of Catalytic Hydrogenation.

(*a*) N. K. ANDERSON AND C. A. ROWE. Experimental Equipment and Procedure.

(*b*) R. B. BECKMANN, A. E. PUFAHL, AND O. A. HOUGEN. Experimental Results.

3:30 P. M.—J. DUDOMAINE, R. L. Swain, AND O. A. HOUGEN. Rate of Base Exchange in Water Softeners.

A. E. Laurence, formerly chief chemist for the Solo Works Division, Perfect Mfg. Co., Cincinnati, Ohio, is now employed in the development department of the Thiokol Corp., Trenton, N. J., on the compounding of synthetic rubbers.

W. W. Skinner Appointed Chief, Chemistry and Engineering, USDA

WILLIAM W. SKINNER has been appointed chief of the Bureau of Agricultural Chemistry and Engineering, U. S. Department of Agriculture, to fill the vacancy left by the death of Henry G. Knight last July.

Born in Baltimore, Md., in 1874, Dr. Skinner has had 38 years of intimate association with the work of the bureau, which he has helped direct as associate chief since 1939. From 1935 to 1939 and from 1921 to 1927 he was assistant chief. In 1927 he was assigned to other duties in connection with chemical and technological research in the bureau.

Dr. Skinner joined the bureau in 1904 as a food inspection chemist and has seen many changes in the organization he helped to build. In the old days it was known simply as the Bureau of Chemistry. Later it took on soils work and became Chemistry and Soils. A few years ago it became Chemistry and Engineering, indicating another change in the scope of the work. Since Pearl Harbor the bureau has been engaged in many vital war projects as one of the seven scientific agencies brought together in the Agricultural Research Administration, under the direction of E. C. Auchter.

During his long career as a government chemist, Dr. Skinner has held office in various scientific organizations, and has served as chairman of the Maryland State Board of Agriculture and the Board of Regents of the University of Maryland.

Data Published on Selective Service

BECAUSE of the wide interest in this subject and the need for obtaining trained men for our Production Army, we give below references to information we have published on occupational deferments, including those of men in training, and the need for technically trained persons. Future developments will be brought to the attention of our readers.

A.

A. I. Ch. E. Streamlined for War

STREAMLINED for wartime efficiency, the 35th annual meeting of the American Institute of Chemical Engineers completed its business in two and a half days, without benefit of entertainment, at the Netherland Plaza, Cincinnati, November 15 to 17.

Operation and protection of plants in wartime and urgent problems of procuring and retaining trained manpower to keep industry at peak production under war conditions were the principal topics of discussion, in addition to two sessions devoted to papers on technical developments in chemical engineering. The business of the institute, consisting of reports of officers and committees, occupied a short business session.

J. L. Bennett, manager of chemical operations, Explosives Department, Hercules Powder Co., was elected president of the institute for 1943, succeeding S. D. Kirkpatrick. George Granger Brown, professor of chemical engineering, University of Michigan, was elected vice president. Stephen L. Tyler and C. R. DeLong were re-elected secretary and treasurer, respectively.

Four directors elected for three-year terms are: Lawrence W. Bass, director, New England Industrial Research Foundation; Barnett F. Dodge, head of the Department of Chemical Engineering, Yale University; Chester L. Knowles, chemical sales director, Dorr Co.; and Charles M. A. Stine, vice president, E. I. du Pont de Nemours & Co., Inc. Francis J. Curtis, Monsanto Chemical Co., was appointed as director by the institute's council to fill the unexpired term of Walter G. Whitman, resigned.

Seriousness of the problem of technically trained manpower was recognized by the institute in voting the passage of a resolution directed to competent governmental authorities, as follows:

As a part of the professional technical manpower of the Nation, the American Institute of Chemical Engineers, assembled at its annual meeting in Cincinnati, Ohio, on November 16, 1942, subscribes to the ensuing statements concerning the supply of engineering manpower and urges the adoption of the suggestions made therein looking toward the assurance of the necessary supply of men trained on a professional engineering level to perform engineering services in the armed forces and in the war industries.

The following are the significant facts:

1. The war industries are an essential part of the war effort.

2. The war industries now need and will continue to need a steady replacement supply of technically trained men both for the maintenance of mass production and for the continued improvement of military material.

J. L. Bennett, President-Elect

3. Information from many sources makes it clear that the supply of professional engineers of all kinds is wholly inadequate to meet the greatly increased requirements of the armed forces and of war production. The problem is made more acute by the increasing loss of men from industry to voluntary enlistment.

4. The engineering schools must continue to be the major source of supply of young engineers. Efforts to enroll women in engineering schools have not yet been successful to any significant extent.

5. The effect of the new draft law will be to throw a considerable proportion of all engineering students into officer training programs and a large proportion of those who cannot qualify physically for officers training into the draft. Neither group will be available for the war industries for the duration.

In view of these facts, we strongly recommend:

(*a*) That the loss of technically trained men from war production plants be stopped by cessation of voluntary enlistment or by a "freezing" order covering such personnel and plants.

(*b*) That selective service Occupational Bulletin No. 10 of last June [see CHEM. ENG. NEWS, 20, 837 (1942)] be reaffirmed in principle in its provisions for the deferment of men in engineering training.

(*c*) That this Directive be modified in the light of the lower draft age by providing for the deferment of engineering students in established colleges to the end of the term in which they reach the age of 18, and thereafter, on a term by term basis as long as their academic records remain satisfactory.

The present capacity of the engineering colleges for entering students is about 40,000 per year. The number of young men reaching age 18 is about 3,000 per day. Therefore, less than 2 weeks' supply of young men would be sufficient to ensure an output of the normal number of young engineers each year. On graduation the number will have been reduced to about 18,000 and the other 22,000 will have been unsuccessful and will have been inducted into the armed forces. Of the 18,000 trained men, approximately one half would meet the physical requirements for eventual commissioning and the rest would be available for war production industries.

As a final result, the armed forces would lose the direct services of only 3 days' supply of those reaching age 18 each year. This small number, insignificant in the total manpower situation, and, in the opinion of many, an absolute minimum for the vast production effort now contemplated, would go far toward ensuring the maintenance of an acceptable level of engineering competence in war production.

Reports of officers and committees showed the affairs of the institute to be in flourishing condition. Membership shows a net gain, as of November 1, of 500 over the figure of a year ago. Present membership was reported to total 3,352 of all classes.

Added during the year to the list of 44 courses in chemical engineering accredited by the institute were those of seven institutions:

University of Maryland
Northeastern University
University of Florida
Oregon State College
Worcester Polytechnic Institute
Bucknell University
Cooper Union School of Engineering (now including night course)

Despite the absence of plant visits and entertainment, which have usually featured meetings of the institute, attendance of members and chemical engineer guests reached a new high with a registration of 430. Although other meetings have shown higher figures for total registration, ladies previously welcomed have accounted for a large share of attendance.

Operating kinks in wartime provided a subject with which many had had experience during World War I. Troubles in converting pyrites burners to handle sulfur in sulfuric acid manufacture, commandeering of vitreous enameled bath tubs as nitrators in picric acid plants, and troubles with pumping systems designed for water but forced to handle volatile solvents were among the many topics of interest to plant operators discussed. Leading discussion were Fred. F. Chapman, Albert E. Marshall, and Albert B. Newman. Henry Howard and Frederic J. Le Maistre gave some of their experiences by letter. The problems of skilled manpower enter this discussion and remained a dominant topic throughout the meeting. Harvey N. Davis, newly appointed director of the Office of Production Research and Development, WPB, developed the subject further at the informal dinner Monday evening.

Seriousness of manpower questions was emphasized by the immensity of demands by both the armed forces (9,700,000 men) and producing industry. The ratio of World War I of 12 men in industry for each man in uniform can obviously not be met now. Also, it seems unlikely that General Hershey's ratio of 4 to 1 will

meet industry's needs. Present terrific drains probably will have grievous effects on our training programs with the continuance of war.

Protection of plants in wartime was the general topic of four papers forming Monday afternoon's program.

Good housekeeping in plants necessary for their protection at all times becomes an acute necessity in war with the added hazard of sabotage, according to Lieutenant-Colonel James C. Sawders, chief, Plant Protection and Safety Branch, C. W. S. In his paper (presented by Major Harry G. Baker, Jr.), Colonel Sawders pointed out the extreme necessity for seeing that all plant services are supervised and all employees identified at all times to ensure against breaks in production. To normal protection from fire, power failure, explosions, theft, and personal injury must be added safeguards against sabotage, efficient guards against strangers, measures to confine employees to specified areas of work, and provisions for continuing operation even in blackouts. Separation of power lines from lighting lines is essential for this purpose, as is a trained staff to supervise operations under blacked-out conditions.

Industrial plants can be made far less obvious targets for air attack by applying modern camouflage methods. This phase of the problem was discussed by Greville Rickard, camouflage specialist, Office of Civilian Defense. The objective, the speaker said, is primarily to confuse the bombardier for even a few seconds as he attempts to select his targets. This can be accomplished in a number of ways which tend to break up the large areas of plants and to blend them with surroundings. Selection of the original plant site, plantings of vegetation, painting, installation of nets to break up shadow patterns, and screening smokes are the preferred methods of destroying visually the patterns the bombardier expects to see. Necessarily the effective use of any of these means requires experience and imagination to prevent an effect opposite to that desired.

Screening smokes offer effective ways of hiding objects and areas. Modern production of these useful smokes was described by Major Frederick G. Schmitt, Office of the Chief Chemical Warfare Service. Effective smoke screens, which hide areas but need not interfere with activity within them, can be laid in 8 minutes by modern methods. Thickness of the smoke screen makes it effective at low density. Criteria in selecting a particular type of smoke are effectiveness of cover, low cost, and harmlessness. Three types are most commonly used: chemical smokes ($TiCl_4$, P_2O_5, etc.), carbonaceous smokes, and fogs of oil produced by vaporized oil in engine exhausts. Screens can be laid in many ways applicable under varying conditions and are among the most effective means of protection of civilian areas as well as troop movements.

Special safety precautions practiced in ordnance plants make them among the safest places to work according to Colonel Crosley Field, Safety Branch, Ordnance Department, in a paper read by Major R. C. Stratton. Tables based on experience of the Ordnance Department show safe distances between quantities of explosive materials to be observed in segregating units within a plant. In addition to this important factor, limitation of personnel and of quantity of explosive material in any particular location to that required for efficient operation is a cardinal principle of safety. Cooperation between operators, Ordnance Department, and the Surgeon General provides special safeguards to the health of workers. A new safety code covering ordnance plants is soon to be issued.

A. O. Snoddy, speaking on "Some Cincinnati Industries", traced the rise of Cincinnati from a village, originally called "Losantiville", to its present size and name, obtained from The Society of the Cincinnati.

The invention of the steamboat with its attendant power to proceed up the river from New Orleans to Cincinnati was one of the biggest contributions to the growth of the city. Before the advent of steam power early industries were based on agriculture and its products. Power, available as it was with these engines, made a difference in the industrial picture and soon factories were displacing the home industries. By 1819 the city had grown to an area of 3 square miles with 1,890 buildings, and 214 shops, 10 churches, and 17 taverns. There was also a tremendous (for the time) steam mill of 70 horsepower which furnished power for four millstones and a textile mill. It consumed 480 tons of coal a year and Mr. Snoddy compared it with modern Cincinnati power plants using about 600,000 tons per year. The Cincinnati soap industries were early playing a part in the city's prosperity. In 1837 William Procter and James Gamble pooled their savings of $7,500 and began the business which is today the massive Procter & Gamble Co. This firm grosses annually $282,000,000 and its Cincinnati plants occupy approximately 200 acres. Mr. Snoddy concluded his paper with examples of soap advertising from the years 1850 and 1937 and showed how little the advertising message has changed during that period.

F. J. Gradishar, W. L. Faith, and J. E. Hedrick reported on work done at Kansas State College on laminar flow of oil-coal suspensions. This investigation, part of a larger program on manufacture and cost of colloidal fuel, was made in order to determine friction losses in pipes carrying the colloidal fuel mixture.

It was found that suspensions of coal in fuel oil may exhibit either viscous or plastic flow depending on concentration. However, at a definite concentration of suspended matter the mechanism will be transformed into plastic flow and the fluid will possess a definite yield value which must be overcome before flow begins. The critical concentration was shown to correspond to the concentration at which the particles just touch each other to form an arch capable of resisting

Howard Arnold, University of Iowa; Henry N. Lyons, Cities Service, and A. E. Marshall, a past president of the Institute, with Harvey N. Davis, Office of Production Research and Development Center. C. R. De Long, treasurer, and R. P. Kite, Dorr Co.; Ernest M. Symmes, Hercules Powder Co. with Stephen L. Tyler, secretary; and Warren L. McCabe, Carnegie Institute of Technology, with J. L. Bennett, newly elected president of the Institute. *Bottom.* George G. Brown, newly elected vice president with J. L. Bennett, M. H. Ittner, Colgate-Palmolive-Peet Co. and George G. Brown, Gaston Du Bois, Monsanto Chemical Co., D. B. Keyes, WPB, Norman W. Krase, du Pont Co., and R. L. Murray, Hooker Electrochemical Co.

slight pressure. The concentration at which zero fluidity occurs as a fluidity-concentration plot was practically identical to the critical concentration. An equation was formulated for suspensions of 200-mesh coal in oil up to 40 per cent by weight which enables the prediction of friction losses.

H. P. Simons, Joseph H. Koffolt, James P. Withrow, and Richard J. Mitchell collaborated in a ponderous report on the drying of rayon—both cakes and skeins. The data presented were the results of 17 years of intermittent studies and experimental work on the effect of various drying conditions.

The first report covered rayon skeins and after a description of the dryer and technique used in obtaining the varied data, the authors summarised their results as follows: Suitably centrifuged rayon skeins were observed to dry solely under falling rate conditions and found to conform to the equation, $-dW/d\theta = 0.78G^{1.61}(\Delta H)W$, where $dW/d\theta$ = rate of drying, pounds of water evaporated per pound of bone-dry stock, G = mass velocity of air, pounds per minute per square foot, ΔH = humidity corresponding to the wet bulb temperature of the air, pounds of water per pound of bone-dry air, and W = free moisture content, pounds of water per pound bone-dry stock. The critical moisture content of 150 denier, 40 filament, spool processed yarn averaged 0.98 pound of water per pound of bone-dry stock. Drying at temperatures up to 200° F. and humidity conditions in line with industrial practice had no measurable effect upon the degradation properties of the yarn as evidenced by wet tensile strength, elongation, copper number, sodium hydroxide boil test, dye test, and cuprammonium disperse viscosity. Drying for prolonged periods at high temperatures, however, had a slightly degrading effect upon the yarn, but this was evidenced only after unnecessarily long drying periods. In conclusion the authors stated that the safe drying temperatures recorded in literature were probably too low and increased dryer production could probably be obtained by use of higher temperatures.

The work on drying rayon cakes was done on 150 denier, 40 filament rayon cakes of viscose pot production. A different equation was found to hold for drying viscose cakes:

$$-dW/d\theta = 0.88G^{1.05}(\Delta H)W$$

Again it was found that drying air temperatures and other conditions had no noticeable effect upon the rayon.

As part of a program to obtain more data for design purposes on liquid-liquid extraction, Olaf Bergelin, Frank J. Lockhart, and George Granger Brown presented a comprehensive report on data obtained from a study of the ternary system tetrachloroethylene–isopropyl alcohol–water.

Physical properties including equilibrium relationship of the liquid system at 77° F. were determined.

The effect of velocity of the phases upon the flow conditions was shown by photographs. It was found impossible to estimate the turbulent characteristics of flow by any orthodox use of Reynolds number, since the velocity distribution in one phase is determined by the flow properties of both phases. When mass velocities of

the phases are equal in magnitude the interfacial velocity approaches zero, which creates a stagnant film in each phase and aids in the accumulation of foreign materials at the interface and the transfer coefficient passes through a minimum point.

A process to remove 88 per cent of the lime in sugar manufacture formed by the addition of sulfuric acid to the molasses, was claimed by G. T. Reich of the Pennsylvania Sugar Co. The calcium sulfate contaminates the yeast, forms scale in the beer still and slop evaporators, and prevents profitable recovery of by-products from the slop. Mr. Reich's new method is said to give the first positive method of removing this unwanted material.

Briefly, the process consists of mixing molasses with a stream of hot water and then passing the mixture to a proportioner which regulates the ratio of molasses to sulfuric acid. This mixture enters the top of a reaction tank where it is heated; the molasses settles continuously and discharges into centrifugals. The clear molasses liquid discharges from the top of the centrifugals while the calcium sulfate and other organic materials are caught in the bottom of the centrifugal basket. This collected sludge is mixed with hot water, discharged into a receiving tank and then into a baffled settler. The separation of this sludge is said to give an increased quality and quantity to all the further sugar processes, especially in the yeast produced and the decreased amounts of calcium scale in the stills.

J. A. Gerster, of Tulane University, and J. H. Koffolt and J. R. Withrow collaborated in an investigation on the extension of Chilton and Colborn's *HTU* method to plate columns. The authors introduced a new concept, the $(PTU)_{OV}$ which is the number of plates equivalent to a transfer unit and similar to the *HTU* expression, inasmuch as it is expressed by

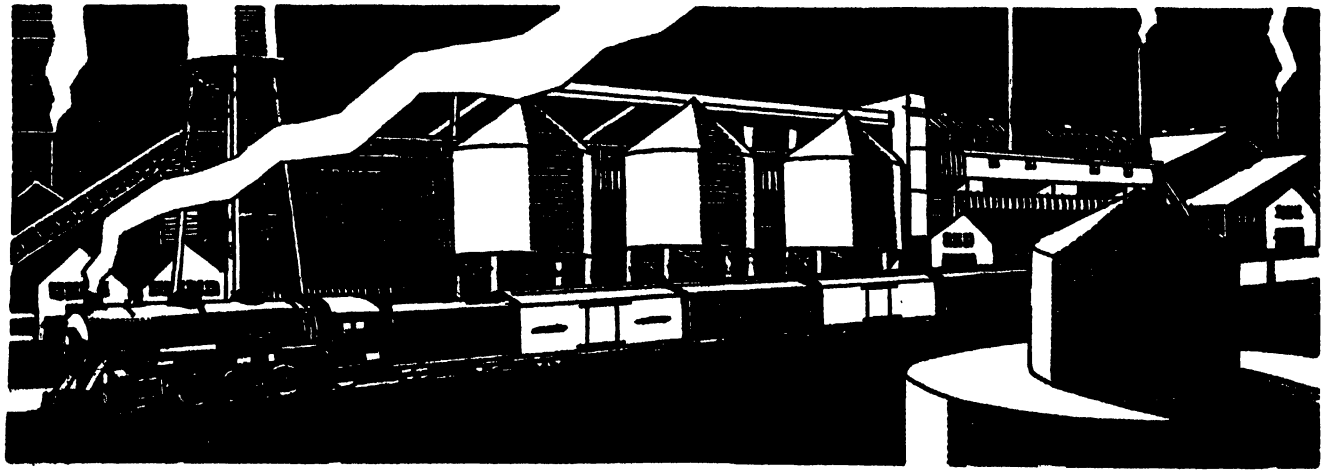
$$(PTU)_{OV} = NP \Big/ \int_{y_1}^{y_2} \frac{dy}{y^* - y}$$

where NP is number of plates, y_1 and y_2 composition of vapor entering and leaving columns, and y^* and y the mole fraction of volatile component in liquid and vapors.

A plot of *PTU* against the slope of the vapor-liquid equilibrium curve gave a simple correlation of results at constant vapor velocity. The authors claimed the existence of a liquid concentration gradient across the plate of a bubble cap and that this method is a logical basis for evaluating still performance, optimum plate spacing, optimum velocity, diameter, and number of bubble caps per plate. Further work is being done.

George Granger Brown and Frank J. Lockhart of the University of Michigan, reported on the effect of vapor load and efficiency in fractionating columns. This work was undertaken to relate available laboratory data to commercial operations. It was found that the over-all plate efficiency for laboratory columns is largely independent of the mass vapor velocity over a wide range of normal operation. At abnormally low vapor velocities the plate efficiency decreases very slowly in the laboratory columns and quite abruptly in the commercial columns.

The principles of stripping were investigated in a treatise by Harold J. Garver, of the University of Cincinnati, and Frank Lerman, of the Blaw Knox Co. Stripping operations, they said, possess the advantage over straight distillation of the volatile components from liquid solutions in that more complete separation can be obtained at lower temperatures for the same conditions of pressure or vacuum. In view of this and the number of uses of stripping operations in industry, the authors undertook to assemble the pertinent data now in the literature.



They compared batch and continuous stripping and showed theoretically that the same operating conditions, irrespective of the phase behavior, consumed more stripping medium in a batch process than in a continuous countercurrent system. A graphical method was given which allowed the easy determination of the number of actual plates required for a continuous plate stripping column.

A new type of rectifying column for use in conjunction with high vacuum stills was discussed by Robert M. Schaffner, of the Standard Oil Co. of Indiana, John R. Bowman, of Mellon Institute, and James Coull, head of the Department of Chemical Engineering at the University of Pittsburgh. The new column is a vertical tube having alternate heated and cooled segments. In operation the vapor from the still rises through the tube and mixes with the alternate zones of vapor created when the reflux flowing down the tube sides is vaporized by the heated segments. At each cooled segment, portions of vapor are condensed and join the main reflux stream. The column thus has an alternate action in stripping out light components and condensing heavy portions.

The still described in the paper was constructed of a glass tube 1 to 5 inches in diameter and 5 feet long. It was provided with 12 heated zones separated by 12 cooled zones. Each section of varied temperature was 2 inches long. Heat was supplied by power through Nichrome windings, the sections being covered on the outside with asbestos. Cooling was effected by jets of compressed air.

In operation, the column reflux rates were measured by an optical glass gage by estimating, through proportion, the thickness of the flowing reflux film. The film thickness could be read to 0.001 inch, and reflux flow rates, through the constant of proportionality between flow rate and the cube of film thickness, could be calculated to within 5 per cent. The column was run at 0.1 to 0.01 mm. of mercury and throughput was 250 ml. per hour.

As is to be expected, tests of the column indicated that an increase in vaporization condensation action increased the separating power of the column. The present column, however, is not so dependent on high reflux as the conventional types. As the reflux ratio was decreased from infinity the new column improved when compared to a column of theoretical plates operated at the same reflux. Efficiency increased rapidly as the volatility ratio of the materials separated decreased toward unity, indicative of a high suitability for rectifying mixtures difficult to separate.

ACTION ON THE AMERICAN CHEMICAL FRONT

[Continued]

Streamlined harvesting with light-weight, high-speed tractor carrying a sharp-bladed knife. From two to twenty acres of vines are mowed in ten hours. Speed is essential since peas for quick-freezing must be harvested the hour they reach the peak of perfection

Development of the Quick-Freezing Process

LEWIS W. WATERS[1], General Foods Corp., Postum Building, 250 Park Ave., New York, N. Y.

THE quick-frozen food business is one of the few industries strictly American in origin. In excellent condition at present and with a promising future, its growth and development constitute one of the most interesting sagas of the food world.

In 1931 when Birds Eye, our pioneer company in the field, was first organized, 10 stores sold frosted foods in the New England city of Springfield. Today 35,000 stores throughout the country feature frosted foods. This year it is estimated the quick-frozen foods business will handle some 400,000,000 pounds.

Although the industry in its early days confined itself exclusively to the quick-freezing of fish, many kinds of foods are quick-frozen today. Meats, poultry, fruits, and vegetables, for example, are now quick-frozen by the latest methods and are preserved in their pristine freshness the year round. In most instances modern equipment is set up in packing plants located near the fields where the crops were planted and, without loss of time or nutritious content, the newly ripened peaches, spinach, string beans, asparagus, strawberries, and other products are quick-frozen and packed for shipment to all parts of the country.

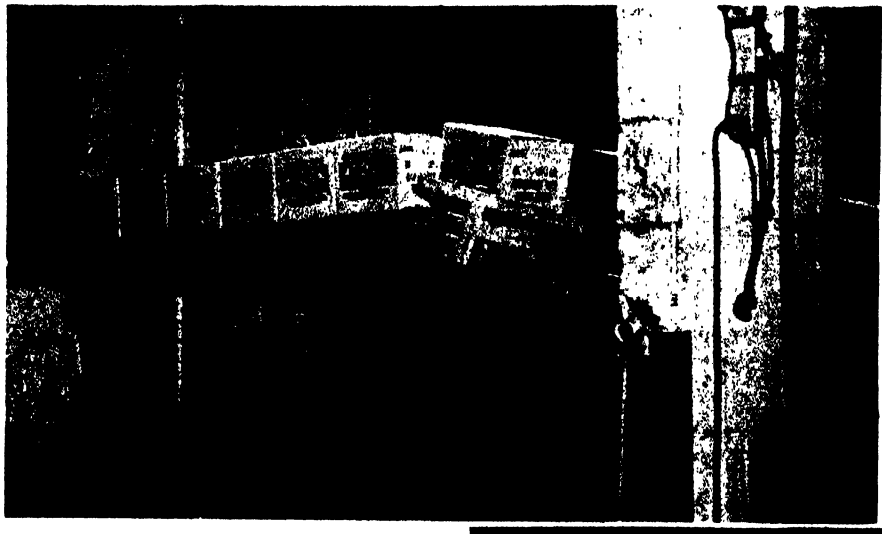
Packaged Birds Eye spinach is slipped into this portable quick-freezing machine by the white-coated operator. In a matter of minutes the shelves will be loaded with trays such as this and the insulated door shut on the intense cold that is developed inside.

Among the advantages of the process is the ability to preserve for year round use perishable fruits and vegetables that formerly could be had only in their regular seasons. Quick-freezing not only preserves the natural taste of the fish, poultry, meats, and vegetables, but retains their maximum vitamin values as well. And once the quick-freezing is done, the freshness of the food is retained indefinitely, and waste owing to spoilage of crops because of glutted markets is avoided.

One of the features of quick-freezing lies in its space-saving quality. A quick-frozen package is compact, sanitary, durable, and appetizing. It takes up only a small portion of the space the product would occupy in its natural state. A carload of Birds Eye spinach is equal to 11 carloads of spinach in its prefrozen state.

The key to the success of quick-freezing lies in minimizing crystal formation. When scientists mastered the problem of

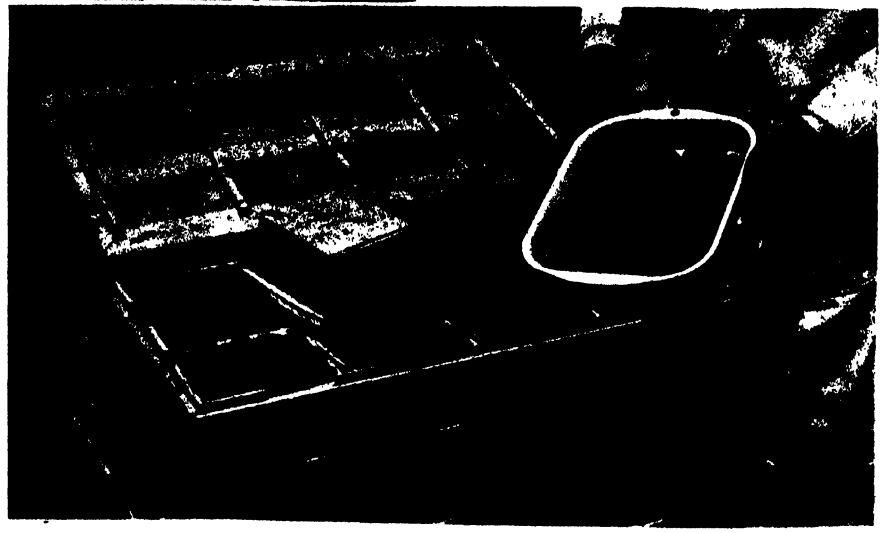
[1] Vice president in charge of Research and Development.



Left. Packages of spinach are assembled on trays and placed in this patented Birds Eye quick-freezer which seals with cold the garden freshness and the nutritional qualities of the choicest leaves of the spinach crop. *Below.* This tractor with a disker attached is being fueled from a gasoline tank wagon on the pea field, inasmuch as every minute counts in the high-speed harvest schedule.

assuring uniformly small crystallization, they opened the way to success for the industry. When solutions are allowed to crystallize, the size of the crystals is in inverse proportion to the time allowed for them to form. The longer the time of crystallization, the larger the individual crystals. This fact is basic in the freezing of food.

Under a microscope, animal tissues are made up of minute cells filled with a semi-liquid protein gel. This gel contains a certain percentage of water in which are dissolved salts containing such elements as sodium, calcium, potassium, and magnesium. Water in which these salts are dissolved does not freeze uniformly in the cells, when the product is slowly frozen. Instead, fresh water begins to crystallize



out of the cellular and intercellular tissues when the temperature is lowered to about 31° F.; and as the temperature is further lowered, more and more water crystallizes as ice, leaving more concentrated solutions of the various salts.

In slowly frozen flesh products, such as meats, fish, and poultry, the crystals may grow to many times the size of the individual cells. Such crystals injure the tissues and the delicate cell walls. On thawing the product, flavor and texture are impaired.

The important problem in quick-freezing is properly to quick-freeze the product in the shortest possible time. In other words, what is the zone of optimum crystal formation, and what procedures

Above. Refrigerator cars are loaded by a conveyor with frozen asparagus tips. *Right.* Strawberries are looked over carefully before being made ready for quick-freezing. Only vegetables and fruits are frozen which meet the high standards set up for trained selectors to use in choosing those to be packed.

are needed to race the product through that zone with the best results in preserving the food?

In 1907 W. D. Richardson and E. J. Scherubel presented a paper before the American Chemical Society on the comparative effects of ordinary freezing and more rapid freezing by convection. Z. Plank and Ehrenbaum and Reuter in 1916 made a more comprehensive study. They were followed by Harden F. Taylor and Clarence Birdseye, who conducted developmental work, mechanical and chemical.

The zone of optimum crystal formation was determined through experiments in the percentage-temperature curve needed for quick-freezing. Experiments by Plank showed that, between the temperatures of 31° to 25° F., about 75 per cent of the total water content is frozen. This was termed the zone of maximum crystal formation.

In the General Foods method, a machine resembling a large metal box is used. When the front and rear sliding doors of this machine are pushed back, the opened box shows a series of multiple metal plates placed one above another. The plates are made of aluminum alloy. They contain curved passages through which the refrigerant is circulated. Normally the plates are held apart with an opening between them greater than the thickness of the product to be frosted. This is accomplished by pins in the four corners of the plates resting on pins in vertical guide bars. This arrangement of pins allows the plates to be freely lifted to insert products and dropped to make contacts on both sides of the product being frozen.

There is virtually no waste material on quick-frozen foods, for the waste is utilized as by-products. When Birds Eye purchases sides of beef, the parts not used are turned back to the processor to be sold as fresh meats. The accumulation of vines and pods, for example, in one central place makes possible the utilization of waste material which could not be used if collected in small quantities. Pods and vines are used as ensilage. Parts of fish not used as frosted fillets are used as fertilizer.

The elimination of waste cuts down on transportation and storage, important factors, especially under present wartime conditions.

One of the greatest problems in the development of quick-freezing was to bridge the gap between the laboratory and the ultimate consumer. It required many millions of dollars of investment, years of development work, and overcoming countless obstacles.

Today Birds Eye foods are served in hundreds of thousands of homes; in institutions—hotels, restaurants, and hospitals; on the high seas; and in the Army. The development is remarkably geared to war economy in every way, and will continue to render increasing service after the war.

Molecular Distillation

K. C. D. HICKMAN, Distillation Products, Inc., Rochester, N. Y.

Soon after molecular distillation was first studied by commercial laboratories, it was found that the vitamins could be stripped from various natural oils in the molecular still, leaving the main bulk of oil unaltered and thus available for other industrial use. Vitamin A was particularly amenable to this treatment, since the fish liver oils in which it occurs provided a bulk of raw material and a ratio of value to bulk which was well suited to the stage of development that the molecular still had reached in the middle 1930's. Vitamin A exists in fish liver oils as a mixture of esters, with the palmitate predominating. The development of stills to operate economically at the high temperatures at which the esters distill (220° to 270° C.) required the parallel evolution of large pumps to carry away the great volume of gases evolved and yet maintain a pressure of a millionth of an atmosphere.

The design of machinery to distill the vitamin A esters was begun in Eastman Kodak Laboratories before 1930. From 1934 onwards the project was sponsored jointly by Eastman Kodak and General Mills until transferred to Distillation Products, Inc., which continues to be concerned chiefly with the distillation of the oil-soluble vitamins.

The vitamin A esters, introduced commercially in 1937, were first produced by five-stage falling-film stills having a capacity of about 400 gallons of crude oil a day. The vacuum was maintained by condensation pumps of the "fractionating" type. In the effort to reduce cost and increase throughput a new kind of molecular still was devised which employed rapidly rotating plates to spread the oil in a thin uniform film for distillation. An installation of 21 centrifugal stills, 32 inches in diameter, was completed in 1941 together with 23 centrifugal units with 14-inch rotors. The 32-inch stills accommodate about 40,000 gallons monthly and are used almost exclusively for processing vitamin A oils. A view of this installation at Distillation Products is shown in Figure 1.

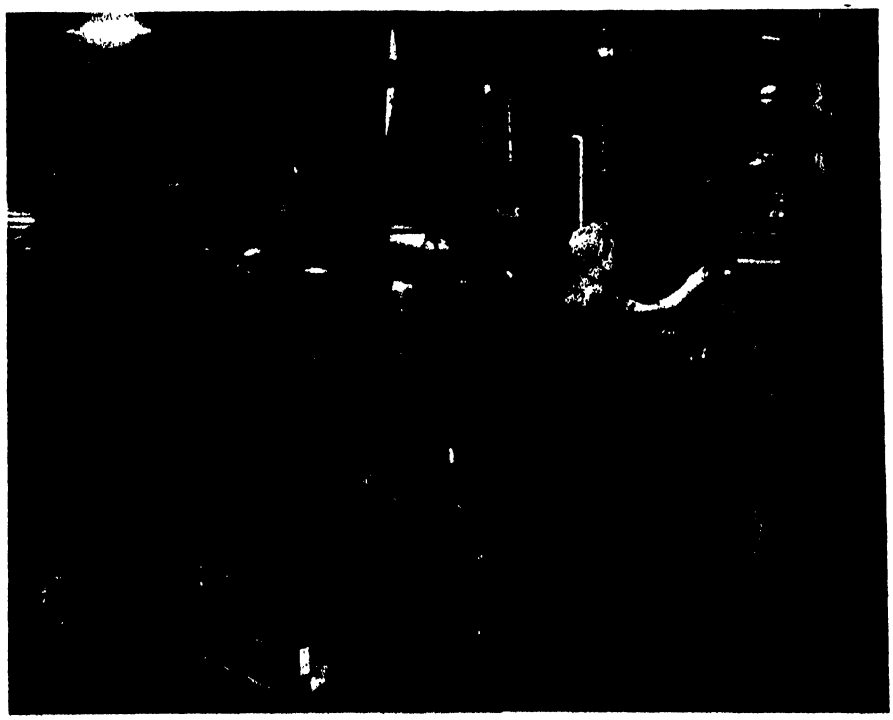


Figure 1. Stills for processing vitamin A oils

Of the other fat-soluble vitamins, only the tocopherols (vitamin E) at present warrant commercial distillation.

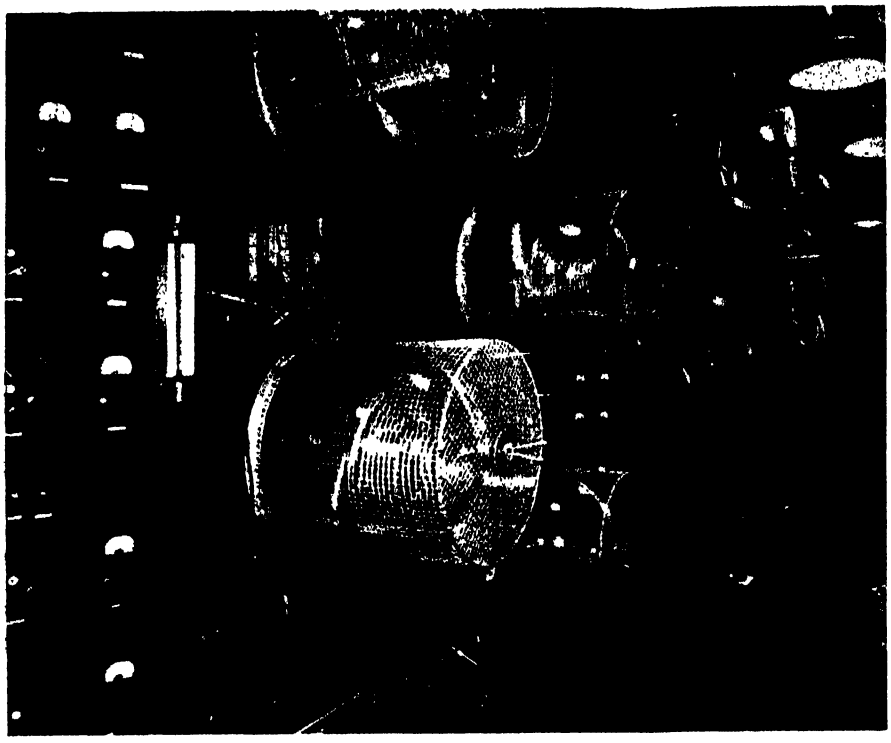

Figure 2.

The separation of vitamin K is not attractive by this means because it occurs in low concentration even in the richest practicable soybean oil, of which about one-third of a gallon must be distilled to provide one human day dose of the vitamin. The distillation of vitamin D from tuna and sardine oil has likewise become unattractive since the manufacture of synthetic vitamin D_3 has been perfected.

The production of vitamin E is now paralleling that of vitamin A. Starting with soybean, cottonseed, and corn oil, a crude distillate is produced which can be concentrated excellently by multiple redistillations. The final steps by which the potency is raised to 40 to 80 per cent mixed tocopherols are performed at Distillation Products on the 14-inch stills shown in Figure 2.

Research in the steroids and the oil-soluble vitamins is being furthered in about equal degree by the molecular still and the Tswett absorption column. Recent advances include the production of pure crystalline vitamin A and its esters, crystalline α-tocopherol acetate, and γ-tocopherol palmitate, and isolation of the new provitamin A, which has been named Kitol, by Embree and Shantz.

American Medicinal Chemistry

E. H. VOLWILER, Abbott Laboratories, North Chicago, Ill.

WHILE it is true that science is one of the very few pursuits of mankind which maintains a semblance of internationality, even in wartime, the major and outstanding contributions of our own nation have been vital. This is especially true in the field of medicinal chemistry. There seems to remain in the minds of some a vestige of the false idea that a majority of the outstanding drugs originated abroad. A very brief résumé of American contributions will show some examples of the fundamental contributions made in our country.

General anesthesia, as we know it today, had its origin in the period from 1842 to 1847, when Morton, Long, and Wells—Americans all—introduced the use of ether. Following the discovery of procaine in 1904, new local anesthetics of real value were developed here. The most generally recognized intravenous anesthetic was developed in the United States less than ten years ago.

Progress in hypnotics and sedatives owes more to developments in this country during the last twenty years than to work in any other land. This was paralleled by the discovery of the effectiveness of a similar product for the control of epilepsy. Constrictors of capillaries are very largely of domestic origin, beginning with epinephrine (adrenalin) and continuing through many analogs of ephedrine, as benzedrine.

Our chemists have led in the development of potent new germicides which as a group perhaps outrank those of any other nation. One of the newest antiseptic agents, gramicidin, discovered in the United States, has led to significant further developments in such studies. Penicillin, discovered in England in 1929, has been the subject of considerable attention in American laboratories during recent years. Sulfanilamide owes its present status to successive major contributions by German, French, English, and American investigators, and later sulfa drugs have been largely of domestic origin.

Ehrlich's discovery of the arsphenamines failed to lead to important further developments of antisyphilitic agents for a number of years, but during the last decade important contributions have occurred, practically all of American origin. Very shortly after the blockade during World War I cut off arsphenamine supplies, our chemists were producing adequate quantities of good quality products, and domestic production has since been measured only in terms of high quality, much lower cost, and greatly enlarged volume.

Among the most significant discoveries in the medicinal field, during the last twenty-five years, were most of the important hormones used today. Thyroxin, the principal male and female sex hormones, insulin, liver extract, adrenal cortex hormones—all claim an American parenthood. Similarly the blood anticoagulants, heparin and dicoumarol, whose possibilities as aids in surgery and certain disease conditions are constantly increasing, have an American origin.

In the vitamin field, too, the contributions have been many. Vitamin A and its first isolation in crystalline form; the preparation of vitamin D; the discovery and syntheses of ascorbic acid, thiamine, nicotinic acid, pyridoxine, pantothenic acid; and, in a different category, vitamin K—all owe a considerable part of their advanced status to the work of able American investigators.

Of direct interest during the war are developments in the field of blood and blood substitutes. The preparation of immense volumes of dried human blood plasma, and, still more recently, of blood albumin, is of typical American origin.

The array of examples could be greatly extended. Briefly summarized, American ingenuity and application in the medicinal field have led to many advances of major importance. Fortunately no one nation will ever contribute all the great ideas in any one field; one can ask only that his country should do more than its share, and this the United States has done.

The Economic Status of the Members of the American Chemical Society (Continued[1])

Approved Report of the Committee on Economic Status

George Calingaert, Walter A. Schmidt, Walter G. Whitman, Frank C. Whitmore, L. W. Bass[2], Chairman

Prepared for the Committee by Andrew Fraser, Jr., Washington, D. C.

BEFORE passing to the analyses of the data reported by the membership regarding the three aspects of their employment status, it is pertinent to note that there are distinct limitations attaching to the findings of the preceding analyses of monthly salary rates. These earnings, to be sure, do indicate the general level of prevailing rates at which the members were able to sell their professional services. There is no justification, however, for applying these general rates of monthly earnings to individual members of the SOCIETY, because at any particular experience level these rates are a composite of earnings. Actually, they include earnings reported by male and female regular members and male and female junior members, among whom there are especially marked differences with respect to formal educational training and professional experience. To obtain, therefore, the best relative measure of their economic status individual members of the SOCIETY are advised to consult the series of special analyses of monthly salary rates presented subsequent to Section 8.

Section 6. Occupational Status of the Membership

In order adequately to cover the possible variations in occupational status in the 15-year period 1926 to 1941, the members of the SOCIETY were asked to indicate what their individual occupational status was in each of the nine years by responding to one, and only one, of the 26 items listed in the questionnaire. The distributions of the responses to these questions are presented in Table 12. Since, however, these particular data are shown without regard to years of professional experience, only a broad picture of the occupational status of the reporting membership as a whole can be derived from them.

They show that, for example, in each of the nine years covered by the survey, as much as 50 per cent of the membership were included in the three occupational statuses of industrial research, technical administration, and college or university teaching. Approximately 30 per cent more in each year were classified in the five occupational statuses designated as analysis and testing, research in basic science, development, production, and nontechnical administration. Among the remaining 18 occupational statuses, postgraduate study excepted, while the combined pro-

2 INCLUDES MEMBERS WHO REPORTED OCCUPATIONAL STATUS BUT NOT THE YEAR IN WHICH THEY ENTERED THE PROFESSION
3 FEWER THAN 100 MEMBERS REPORTED
4 LESS THAN 0.05 PERCENT

portions of the membership so classified covered nearly 20 per cent, the proportion for any single occupational status generally did not exceed 2 per cent.

From the data in Table 12 it is possible also to trace the shifting pattern that occurred among the several occupational statuses. Over the whole period 1926 to 1941 this particular analysis shows that steady increases in membership proportions occurred in 15 of the statuses, while steady decreases appeared in nine of them. Only one, safety engineering, showed no change in proportions over the 15-year period. In each of the years in the period 1932 to 1941, fewer than 0.05 per cent of all the members reporting were classified as being on direct relief.

The over-all extent of these fluctuations in membership proportions is measured by the fact that they effected a gross net

1 LESS THAN 0.05 PERCENT

change of 21 per cent over the whole period 1926 to 1941. Essentially this means that in this period 210 in every 1,000 of the membership were affected by the shifts which occurred among the 26 occupational statuses. Of the total net increase of 21 per cent in the 15 statuses that showed relative increases, no less than 9.1 per cent covered industrial research alone; 6.7 per cent technical administration, and 1.6 per cent development; but among the remaining 12 occupational statuses in which relative increases also occurred the range in proportions was from only 0.1 to 0.6 per cent. The negative part of the net change included a relative decline of 6.2 per cent in the proportions of members classified as being in college or university teaching, a 6.7 per cent relative decline in analysis and testing, and relative decreases of 4.6 and 2.4 per cent in the proportions reported over the period for postgraduate study and secondary school teaching, respectively. Negligible declines occurred among the remaining five occupational statuses.

It is apparent of course that these overall comparisons have limited application. They do not reveal, for example, as Table 13 does, how the membership was distributed within each occupational status by years of professional experience. It should be emphasized that, because of the variations in the lengths of the several experience spans of the membership, no direct comparisons of the data in Table 13 with similar data for earlier years is possible.

Furthermore, neither Table 12 nor Table 13 can be used to derive information on two important aspects of the economic status of the membership: first, as to what extent the shifts in occupational status were affected by years of advancing experience; and second, as to what shifts occurred among the statuses reported by members with corresponding years of professional experience in the period 1926 to 1941. The information required for these two distinct analyses, however, may be readily obtained by contrasting the data for 1941 shown in Table 14 with data similarly compiled for each of the eight prior years covered by the survey.

To trace the shifts in occupational status with advancing years of experience the data for four experience levels in the 1926 experience span have been selected and are

presented in Table 15. Analysis shows that the shifts of the youngest of these four selected groups of members among the 26 occupational statuses effectuated a gross net change of 51.2 per cent over the whole period 1926 to 1941. By 1941, therefore, over 50 in every 100 of this group found themselves in a different occupational status than in 1926. Taken in order of increasing age, the net changes over the same period for the other three groups of members were 30, 21, and 8 per cent. This marked relative decline in the shifts of the membership among the several statuses is precisely what would be expected with advancing years and experience—that most of the membership reporting had made final choice regarding their occupational status somewhere between 40 and 44 years of age.

Of further interest to the membership is the fact that from Table 15 it is possible to derive information concerning the occupational statuses which were used by the majority of them as essentially training grounds and fields of final choice. For the majority of the membership the principal training grounds apparently were industrial research, analysis and testing, secondary school teaching, and postgraduate study. To illustrate this situation, in 1926 while 10.5 per cent of the youngest group of members reported industrial research as their occupational status, and the proportion had increased to 28.9 per cent by 1934, by 1941 it had declined to 23.5 per cent. For members who had had 3 to 5 years' professional experience in 1926 the proportions, on the other hand, steadily declined with advancing age from 20 to 17.4 per cent over the 15-year period; and for the next two oldest age groups the proportions, also classified in industrial research, declined from 20.1 to 13.8 per cent, and from 11.7 to 9.2 per cent. Relatively, the sharpest continuous declines in proportions for each age group occurred in analysis and testing; they were, however, less marked for secondary school teaching. In the case of postgraduate study, the declines in proportions over the period 1926 to 1941, were, as would be expected, most marked for the youngest of the four groups of members.

Among all four age groups these declines in proportions were in large part accounted for by relatively sharp increases in the proportions of members classified in technical administration. And since these increases, together with those reported for nontechnical administration, independent consulting, patents, and library and information service, accounted for virtually all of the decreases previously noted, it is reasonable to assume that these occupational statuses constituted fields of final choice for the greater part of the membership which was involved in the shifts

made among the several occupational statuses.

Despite the emphasis that has been placed upon tracing the pattern of movement among the several occupational statuses it should be recognised also that, in each of the four age groups dealt with, a number of the statuses showed relative stability with advancing age and experience over the period 1926 to 1941. Collectively these statuses included a substantial number of the membership. No reasons, however, can be given to explain why this situation existed.

To trace the effects of the fluctuations in economic activity which occurred over the period 1926 to 1941 upon the distributions of occupational statuses, it is necessary to compare the data reported by members who had approximately the same experience spans. For purposes of analysis again four groups of members have been selected. The data reported by them in each of the nine years are presented in Table 16.

In so far as occupational status is concerned these data clearly demonstrate that it was the younger members of the SOCIETY who suffered, relatively, the most from unemployment in the great depression years. In 1932 no less than 5.3 per cent of the membership who had just qualified for professional work were unemployed. Unemployment also affected 1.5 per cent of the membership, who, in 1932, had had from 3 to 5 years' professional experience. Among the other two groups of members unemployment in 1932 was negligible. Although unemployment among the membership was highest in 1932, small proportions of each of the four groups were so classified in practically every year in the period 1926 to 1941.

The reported data on postgraduate study and non-professional work again emphasize the difficulties encountered by the younger members in obtaining regular professional work. This is evidenced by the fact that, for members just beginning their professional careers, in 1929 22.2 per cent were classified as being engaged in postgraduate study but by 1932 the proportion was as high as 29 per cent for members with similar experience spans in that year. The relative increase in proportions in nonprofessional work over the same period for the same two groups of members was from 0.7 to 5.9 per cent. The situation noted above with respect to postgraduate study was paralleled by the proportions reported by members who had been professionally active for 3 to 5 years. It was found also to exist, but to a much lesser extent, among members with from 13 to 16 years' professional experience.

Despite the fact that members with longer experience spans did not suffer unduly from unemployment in 1932, the data in Table 16 make clear that like the members with shorter experience spans they, too, had to make adjustments to meet the then prevailing economic conditions. This is partially evidenced by the fact that members who had from 13 to 16, and 22 to 26 years' professional experience in 1932 reported relatively higher proportions in that year for college or university teaching than were reported by members with similar experience spans in either 1929 or 1934. These increased proportions in 1932 were in large part accounted for by declines in the proportions reported for industrial research and technical administration, which, in turn, were relatively lower than those reported for 1929 or 1934.

Subsequent to 1932 the data in Table 16 evidence the increasing tempo of the country's prewar and war efforts. Relatively, marked increases had occurred by 1941, for example, in the proportions of members with the same experience spans who reported they were engaged in industrial research. These several proportions in fact for 1941 were relatively very much greater than those reported by similarly experienced members in 1929 which was also a year of exceptionally high industrial activity. The effect of the increased industrial activity upon the membership is reflected also in the exodus of members from college or university teaching in all but the group with 22 to 26 years of professional experience. The increased demands for industrial research workers and technical administrators seem to have been partially met by drawing from the members engaged in analysis and testing; the services of the remainder appear to have been diverted to development and production.

Section 7. Sources of Employment of the Membership

In order to cover all aspects of sources of employment, the membership was asked to specify one of six public or one of six nonpublic sources in each of the nine years, or to report their status with respect to retirement, unemployment, or direct relief. The last two topics, it should be noted, were combined in one query.

Considered without regard to age, comparisons among the data shown in Table 17 for total public employment, total nonpublic employment, retirement, and unemployment or direct relief evidence the fact that the shifts which occurred among these four groupings of sources of employment over the whole period 1926 to 1941 were relatively negligible in that they affected only 33 in every 1,000 of the membership. The positive part of this gross net change of 3.3 per cent included a 2.9 per cent increase in total nonpublic employment and an 0.4 per cent increase for members who reported they had retired. The negative part of gross net change covered a 3.2 per cent decrease in total public employment and a decrease

6 INCLUDES EDUCATIONAL INSTITUTIONS EXCLUSIVE OF THOSE UNDER PUBLIC AUTHORITIES
7 LABORATORY, FIRM OR OFFICE
8 INCLUDES PUBLISHING ORGANIZATIONS

of 0.1 per cent for members classified as being unemployed or on direct relief.

Among the separate sources of public employment, however, it should be noted that over the 15-year period while federal employment increased by 2.3 per cent, all other categories of public employment decreased by 5.5 per cent. As much as 3.6 per cent of this net change embraced members in the employ of state governments, 1.4 per cent covered members employed by municipal governments, and only 0.5 per cent included the combined declines in membership employment with other public authorities and county governments.

By contrast, among the separate categories of total nonpublic employment the net change of 2.9 per cent has been derived from a 10.2 per cent increase over the 15-year period in private firm employment and an 0.2 per cent increase in consulting, in contrast to net decreases of 7.3 per cent in membership employment with educational institutions exclusive of those under public authorities, and negligible declines of 0.1 per cent in research institute employment and other nonpublic employment.

It is apparent, too, from the data in Table 17 that in each of the nine years in the period 1926 to 1941 the membership as a whole was predominantly dependent upon nonpublic sources of employment. In 1926, 78.2 per cent of all members reporting were so classified as against 21.3 per cent who were then in the employ of public authorities. By 1941, however, total public employment embraced only

18.1 per cent of the membership as against 81.1 per cent who were in the employ of all nonpublic agencies.

Despite the net changes in proportions noted to have occurred over the period 1926 to 1941, the separate categories maintained the same ranking order. In the case of public agencies, state government gave employment to a larger proportion of the membership than did the Federal Government, which was followed in order by municipal government, other public authorities, and county government employment. It is of interest to note that WPA or work relief embraced a negligible proportion of the membership in the period 1929 to 1941.

Of all members classified as being in the employ of nonpublic agencies, over 75 per cent were dependent upon private firms for their employment. Approximately one eighth more were engaged by educational institutions. Most of the remaining one eighth were shown as being in consulting work, followed in order by research institutes, technical or trade associations, and other nonpublic agencies.

Since the remainder of this particular analysis is similar in pattern to that followed in the earlier discussion of occupational statuses of the membership, passing reference only is made to Table 18 and Table 19. The former shows the distributions in 1941 within each source of employment of all members reporting, by year of entering the profession. In the latter table there is presented for each year of entering the profession the distributions in 1941 of all members reporting source of employment. It is from this second table, and similar compilations for the eight prior years, that the data have been obtained to examine the changes that took place in the membership's sources of employment with advancing years of experience, as well as those for corresponding years after entering the profession.

With advancing years of experience Table 20 clearly demonstrates that in both total public employment and total nonpublic employment there was virtually no change in the proportions reported by the membership from year to year in the period 1926 to 1941. Another interesting feature of these data is that among the three youngest of the four selected groups of members the proportions of each group classified in total public employment and total nonpublic employment were practically the same and averaged, respectively, 20 and 80 per cent. The corresponding figures for members who had had 17 to 21 years' experience in 1926 were slightly higher. These were 24 and 75 per cent.

Thus far, therefore, the analysis seems to indicate that with advancing years and experience there was little or no transfer by the membership from public to nonpublic employment. This is partially substantiated by the fact that, among the separate categories of total public and total nonpublic employment, the propor-

PROFESSION

NOTE: SEE TABLE 22 FOR STUB FOOTNOTES 1 TO 18 INCLUSIVE

tions reported in each of the nine years in the period 1926 to 1941 by the two oldest groups of members showed practically no variation. And although marked shifts occurred from year to year in the proportions of the two younger groups of members classified in the separate sources of public and nonpublic employment, it will be recalled that over the period 1926 to 1941 the totals of these separate proportions also remained fairly stable.

Consideration of the movements from one category of public employment to another in the case of members who had just begun their professional work in 1926 shows that with advancing years and experience total public employment for this group gradually declined from 20.7 per cent in 1926 to 19.3 per cent in 1941. This net decrease of 1.4 per cent over the period covers a 4.1 per cent net increase

in federal government employment and a 5.5 per cent net decrease in all other categories of public employment combined among this group of members. Their changes in total nonpublic employment over the same period were much sharper, in that private firm employment for the group increased over the 15-year period by 19.9 per cent from 42.5 per cent in 1926 to 62.4 per cent in 1941. The compensating decline was in large measure accounted for by the decrease in educational institution employment of 15.7 per cent. This category, in fact, in 1926 gave employment to 25.7 per cent of this group, but to only 10 per cent in 1941. The net declines in proportions reported for consulting and employment in research institutes totaled 1.8 per cent. This pattern of movement was paralleled in every respect by the shifts reported for members who had had from 3 to 5 years' experience in 1926.

It is evident, therefore, from the preceding analysis that, with advancing years and experience, it was the younger members of the Society who were primarily responsible for the movements which occurred among the several sources of public and nonpublic employment. For the period 1926 to 1941, while the Federal Government may be considered the source of final employment, all other categories of public employment may be considered training grounds. In the case of nonpublic employment the field of final employment was that of private firms.

NOTE: SEE TABLE 22 FOR STUB FOOTNOTES 1 TO 18 INCLUSIVE

From the data in Table 21, which contrasts the distributions of sources of employment reported in each of the nine years by members with corresponding years of experience, it is again evident that, in 1932 the incidence of unemployment was greater among the members with short experience spans than among those with longer experience spans. Also for those members who were employed in 1932, but who were affected by the decline in private firm employment which occurred in that year, unemployment was avoided only because they obtained jobs with state governments and with educational institutions.

Over the whole period 1926 to 1941, however, only for members with from 13 to 16 years' experience were the proportions reported consistently the same for the several categories of public employment. Among these groups of members the over-all decline in their employment by educational institutions was absorbed by a corresponding increase in private firm employment.

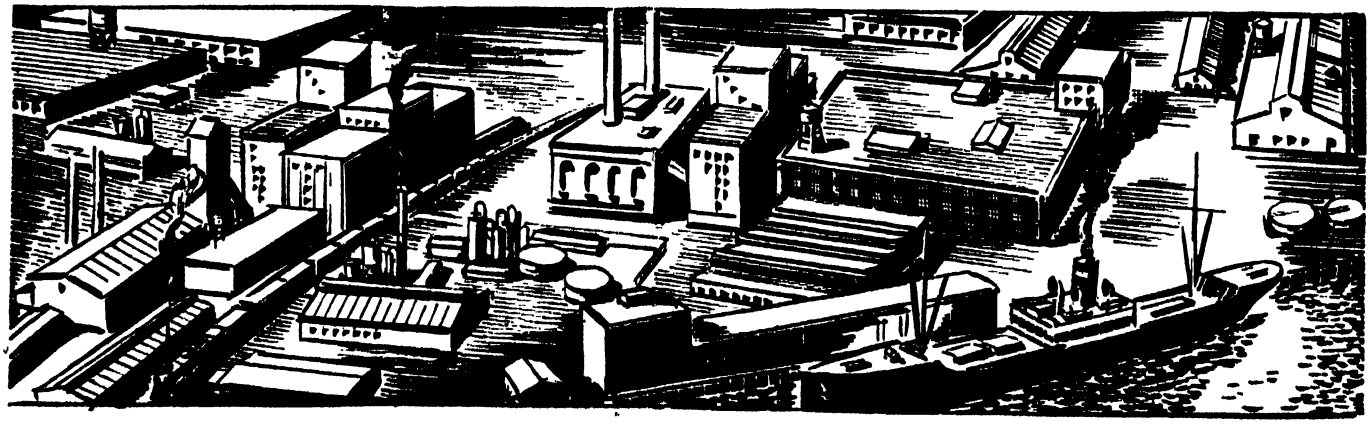
Among the other several groups of members with experience spans greater and less than 13 to 16 years the proportions reported by them for private firm employment also increased in each of the years subsequent to 1932. For members with one half, and with from 3 to 5 years' professional experience, the greater part of the marked net increase in this class of employment was accounted for by marked declines in the proportions classified from year to year with educational institutions.

By contrast, among members who had had from 22 to 26 years of professional experience in each of the nine years, while their proportions in the employ of educational institutions remained approximately the same from year to year, progressive declines were reported for consulting work. From 1926 to 1941, smaller proportions of these same groups of members found employment with the Federal Government and with municipal governments. On the other hand, while among the other three selected groups of members, each with similar experience spans, the proportions reported for municipal government employment also declined, those covering federal government employment actually increased.

Section 8. Fields of Specialization of the Membership

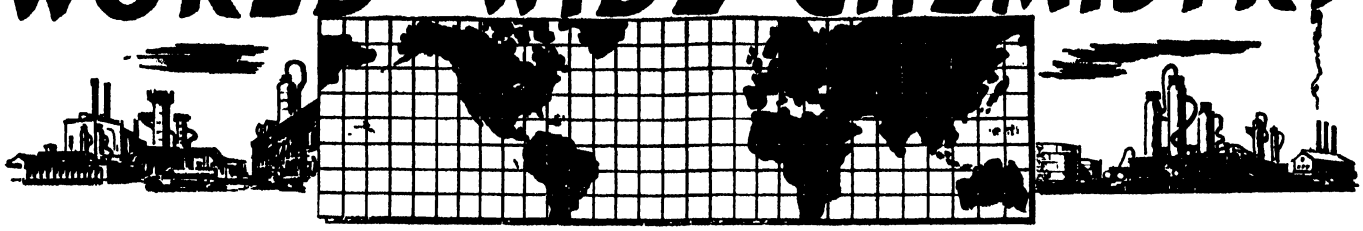
According to the data in Table 22 the movements of the membership over the period 1926 to 1941 were such that, by 1941, 12 in every 100 had located themselves in different fields of specialization than they were in in 1926. This gross net change was relatively nearly four times as great as the corresponding net change previously derived from the similar analysis of sources of employment. It was, however, only one half the over-all net change, also derived from the data reported without regard to years of professional experience, for occupational statuses of the membership.

Comparisons among the proportions reported for each of the 34 fields of specialization show that over the 15-year period covered by the survey 8.1 per cent of the total positive net change of 11.8 per cent was accounted for by increases of 2.8, 2.6, 1.5, and 1.2 per cent, respectively, in synthetic resins, petroleum and its products, pharmaceuticals, and organic chemical technology. Of the total negative net change of 11.8 per cent, 7.5 per cent was accounted for by decreases of 3.3, 3.0, and 1.2 per cent, respectively, in general chemistry, physical chemistry, and organic chemistry. Over the period of 1926 to 1941 no changes in proportions occurred in the four fields of specialization designated "textiles", "public health", "transportation equipment", and "motor vehicles". The remaining 22 fields of specialization were equally divided as between those which showed net increases and decreases. Among these the range in proportions of the membership affected over the period 1926 to 1941 was exactly the same—namely, from 0.1 to 0.9 per cent.



To maintain a pattern of analysis similar to that used in the discussions of the occupational statuses and the sources of employment, Tables 23 and 24 are included in the body of the report. It is from the series of tables similar to Table 24 that the information has been derived for selected groups of the membership whereby analyses can be made to determine their movements with advancing years and experience among the 34 fields of specialization and how the several distributions compared for selected groups of members with corresponding years of experience.

With advancing age (Table 25) members who had had one-half year of professional experience in 1926 reported a net change over the period 1926 to 1941 in their fields of specialization that affected 21.1 in every 100 of the group. The corresponding net change for members who had had from 3 to 5 years' experience in 1926 was 11.6 per cent. For the next two oldest groups of members the net change was virtually nil, a clear indication that before the age of 35 the membership as a whole had made final choice as to the field of specialization. Among the younger members of the SOCIETY their movements involved the same fields of specialization noted in the earlier discussion of similar data reported by the membership without regard to years of professional experience. This merely indicates that the principal fields of specialization used by the membership in the period 1926 to 1941 as training grounds were general chemistry, physical chemistry, and organic chemistry, and those desired as fields of specialization of final choice were synthetic resins, petroleum and its products, pharmaceuticals, and organic chemical technology.



From the data in Table 26, in which the proportions of four selected groups of members with similar experience spans are shown for each of the 34 fields of specialization, it is again evident that movement among these fields was confined to members with short experience spans.

In summary, therefore, these broad analyses of three aspects of employment status of the membership show that in the period 1926 to 1941 their choice of both field of specialization and source of employment was made at a relatively much earlier age than was the case with occupational status. As regards source of employment there was virtually no movement from public to nonpublic employment over the same period. Among the several categories of public employment and nonpublic employment there were, however, significant shifts.

(To be continued)

WORLD-WIDE CHEMISTRY

It was surprising to learn from the Japanese September broadcast that a new project for synthetic rubber had been developed as the result of studies of the Scientific Research Institute of the Kyoto Imperial Institution. The synthetic rubber is claimed to be made by a two-process method, compared with the four-process method of Germany based on acetylene, and the three-process method of the Soviet Union using alcohol as raw material.

The Japanese broadcast in October announced that the Goodyear factory at Buitenzorg, which up to that date was manufacturing only bicycle tires, would shortly be operated at full capacity. Before the Japanese occupation, this factory was partly destroyed. The heavy collander for impregnating the canvas was totally destroyed, and the available stocks of zinc oxide, accelerators, and other chemicals used in rubber manufacture had been removed and destroyed.

Production of Natural Rubber Is Not Curtailed

According to Japanese news sources the production of natural rubber is not being curtailed, as production has to continue to prevent general unemployment in the rubber area.

Rubber Used as Source of High Octane Gasoline

The Japanese also say that the excess rubber they are obtaining is being used for the production of gasoline. Rubber and petroleum experts are producing high octane gasoline from rubber.

A factory has been installed near Kuala Lumpur for the transformation of Hevea rubber from North Sumatra and the Straits by dry distillation and by using the low-boiling unsaturated hydrocarbons for alkylation and hydrogenation. The first plant for production of 100 tons of high octane aviation gasoline per month has been put into operation. It is the intention of the Japanese to increase the quantity as time goes on.

The use of rubber as a source of high octane gasoline has been studied before, also in the Netherlands Indies. Perhaps it will be possible to use the oil refinery installations for the manufacture of high octane gasoline. The N. E. I. installations have been destroyed, but some exist in Japan and the Japs collected the available information on the subject of producing high octane gasoline before the war started.

The Japs mentioned that 400,000 laborers are employed at the Sumatra and Malayan plantations. From German sources it was learned that 30 per cent of the Dutch employees engaged in agricultural industries in Sumatra have been put to work again.

The Agricultural Experimental Station in Medan is managed by the Japanese; this station is now directing the big rubber concerns in Northern Sumatra, such as the Rubber Cultuur Maatschappij Amsterdam (the Rubber Plantation Co. Amsterdam), the U. S. Rubber, the H. V. A., and Goodyear.

Oil Industry Looks Hopeful

The Japanese have announced that they are again using the oil wells at Tarakan. This oil can be used as fuel oil for the Japanese fleet. The Japanese have given notice that the Wonokromo refinery near Surabaya has resumed operation, using crude oil from the Kroeka oil wells, also situated near Surabaya. They are expecting a yearly output of 200,000 tons. The annual capacity of the oil wells in this region of Java before the outbreak of the war was 700,000 tons.

The Japanese claim that Dutch New Guinea is to be considered one of the treasure houses for Japan in the Southwest Pacific. Fermia Sytal, adviser of the Nanjo Development Co., who investigated northern parts of New Guinea on several occasions before the war, has guaranteed a bright prospect for the development of the oil industry in this region of the N. E. I.

Quinine Production Assured by Japanese

The Japanese have announced that they will assure a yearly production of 150 tons of quinine sulfate, required for treatment of malaria in the "Co-Prosperity Sphere".

The capacity of the Bandoengsche Kinine Fabriek (Bandoeng quinine factory), which was able to handle all the cinchona bark of Java and which has been in large part destroyed, had an annual capacity of about 1,000 tons.

Billiton Tin Mines Destroyed

It has also been announced by the Japanese that the Perak tin mines (Malaya) have resumed operation. They made the same announcement in regard to the Netherlands Indies tin mines at Bangka, Singkep, and Billiton. However, the tools, motors, and all other mechanical equipment of the latter mines have been destroyed or removed from Billiton to other islands.

Sugar Supply to Be Reduced

The production of Java sugar will be reduced in 1943 to 600,000 tons, a reduction of more than 50 per cent, compared with the 1941 and the expected 1942 crop. The Japanese announced that they will try to use the Java sugar industry to the fullest possible extent, since they consider it the most modern and efficient in the Southeast Asian countries.

Salt Production Decreased One Half

The normal production of salt, which is concentrated on the Island of Madura, has been reduced considerably. The normal production is 300,000 tons annually, with a local consumption of 200,000 tons and an export of 100,000 tons. It was announced that the salt production has decreased to about 150,000 tons.

Paper Industry in Java Continues

The paper industry in Java, according to the Japanese, has resumed operation. Java has two paper factories with an annual capacity of 4,500 tons each, including cigaret paper.

It was also announced that a paper mill, costing 20,000,000 yen ($6,500,000), will be built shortly.

Steel Foundry Resumes Operations

The Japanese announced that one of the foundry works has resumed operations, producing 300 tons of steel per month. This achievement has no great significance when it is remembered that the annual iron consumption of Java itself was 120,000 tons.

The Japanese further announced that important equipment of the General Motors plant at Tandjong Priok, near Batavia, which had been moved to the interior of Java and completely destroyed, has been found.

Sugar Cane Areas to Produce Cotton

The Japanese have announced that the kapok plantations have been put under military supervision. However, of the total of 480,000 acres planted with kapok, only 60,000 acres are part of plantations. The remaining area, planted with kapok, belongs to native growers. The Japanese have also announced that in the Philippines 45,000 acres of land planted up to now with sugar cane, will be transformed to cotton-growing, in order to make the Philippines one of the large cotton-producing centers of Southeast Asia.

Textile Factories Resume Operation on Limited Scale

The textile factories, which were left intact on account of their importance to the native population for clothing have resumed operations on a reduced scale.

India Increases Explosives Production

INDIA is rapidly attaining self-sufficiency in the manufacture of high explosives, according to a report to our Government. Pure toluene for nitration is being produced, it is stated, at a new benzene-toluene plant; a nitric acid plant, recently installed in an explosives factory, has passed acceptance tests. The first unit of a sulfuric acid concentration plant of Indian manufacture has also been found satisfactory and additional plants have been ordered. Production on a plant scale of mineral jelly for cordite has been successful; a new process for making the latter has been developed which eliminates the use of imported materials. Mercury fulminate for detonators and kieselguhr for making dynamite are being manufactured and a TNT plant is nearing completion.

Physical Chemistry in the Soviet Union

TO BE effective, research into physical chemistry requires good laboratories and workshops, with abundant equipment, none of which Russia possessed in pre-revolutionary times. These few words are necessary to appreciate the progress made by physical chemistry in the Soviet Union in the course of the past 25 years. How different is the picture today! In my institute in Leningrad, for instance, there were large workshops at the disposal of budding scientists, with a staff of 40 workmen, each of whom was a past master in his field.

Physical chemistry in the Soviet Union originally developed along two main lines —physical and chemical. The first originated in the Physicotechnical Institute under A. Joffee and in the Optical Institute under D. Rozhedestvensky, both in Leningrad, and was subsequently often referred to as chemical physics. In the early twenties the Laboratory of Electronic Chemistry of the Physicotechnical Institute was founded under the direction of the author of these lines, and in 1931 was converted into a large independent Institute of Chemical Physics. A similar process of concentration of physicochemical forces also proceeded in the Optical Institute, the Optical Glass Department being formed under Grebenshchikov and the Photographic and Photochemical Branch under Terenin.

As for the second or chemical trend, the Karpov Physicochemical Institute was founded in Moscow under the direction of Bach. At the same time the Ukrainian Institute of Physical Chemistry was founded in Dniepropetrovsk, first under Pisarevsky and then under his disciple Brodsky.

On the initiative of the Leningrad group, the first physicochemical conference was convened in Leningrad in 1927. This conference marked the inauguration of new trends in chemical kinetics, which led to results that have aroused the interest of the scientific world. To anticipate a little, the seventh conference, likewise devoted to chemical kinetics, which met in Leningrad in 1931, bore something of the character of an international congress; nine eminent foreign scientists read papers, while papers were sent in by leading physicochemists, Langmuir and Taylor, of America, and Hinshelwood and Garner of England.

In the thirties Soviet physical chemistry developed into a powerful science, with wide ramifications in diverse fields of theory and practice. It may be safely said that in the past 25 years, Soviet physical chemistry has won for itself a leading place in highly important branches. Most characteristic of its development in this period is the work done in three branches: structure of matter, speed of chemical reactions or chemical kinetics, and chemical phenomena on surfaces of bodies.

In the first of these branches Soviet science has done comparatively little, but even here certain important achievements are to be recorded. One of the most important discoveries of this period—combined scattering of light by molecules, or the Raman effect—was simultaneously and independently discovered by the Indian scientist Raman and the Soviet scientists Mandelstam and Landsberg. We know what an important part this phenomenon has played in the study of the structure of matter. Subsequent Soviet work, notably by Gross, has considerably facilitated progress in this field. Kapustinsky devised simple and reliable methods for calculating the energy of crystal screens, successfully applied in geochemistry; Syrkin applied definitions of dipolar factors in the calculation of molecular structure; the Optical Institute worked on fine structure of molecular spectra, etc.

The pioneer role of Soviet physical chemistry in the second and third branches is generally acknowledged.

Together with the German scientist Frank, Nobel Prize winner and exile from Nazi Germany, the Soviet scientists Terenin and Kondratyev laid the foundations of modern photochemistry by their experiments on the disintegration of salt vapors by light, and electronic bombardment. Subsequently these scientists took an active share in the foundation of the science of elementary chemical processes (transmission of energy, elementary reactions of atoms, molecules, etc.). In the twenties Semenov and his collaborators, parallel with the school of the Englishman Hinshelwood, laid the foundations for the study of chain reactions. Their views aroused the interest of foreign researchers and active work in this field in all countries resulted in the science of chain reactions becoming one of the fundamental branches of chemical kinetics, embracing important chemical processes.

The modern theory of combustion and explosions has likewise been largely developed by Soviet scientists—Hariton, Zeldovich, Sokolik, Neuman, Semenov, and other staff members of the Institute of Physical Chemistry.

The work of Rosinsky on pseudochemical reactions in solids, of Rabinovich on processes of photographic development, and of Roginsky, Balandin, Temkin, and others on the theory of catalysis, made no little contribution to the world progress of

chemical kinetics of heterogeneous reactions. No less definite and even more numerous are the achievements of Soviet physical chemistry in the development of the science of phenomena on surfaces of bodies.

The precipitation of metals on electrodes during the passage of a current through a solution and electrolysis in general, work on dry cells and accumulators, phenomena of solution, and corrosion of metals—all these important electrochemical phenomena are connected with the behavior of the so-called double electric layer on surface electrodes. New stimulus to electrochemistry was given by the theory of building up and breaking down of this double layer.

With the German exile Stern, Frumkin is the founder of the modern theory in this field. Extensive theoretical and experimental work of Frumkin and his school threw light on details of structure of the double layer, on kinetics of its discharge in electrodes, and the value of these phenomena in theoretical and applied electrochemistry. It would scarcely be an exaggeration to say that Frumkin's school takes the lead in modern theoretical electrochemistry.

An interesting Soviet school in the field of surface phenomena was founded by Rebinder. Apart from his extensive work on the influence of superficial layers on the properties of emulsions in suspension and colloids, of special interest is his latest work on the influence of environmental medium on elasticity, plasticity, and strength of solids. Addition of the slightest admixture of superficially active substances to a neutral fluid surrounding a solid body has considerable influence on its mechanical properties and in particular on its strength. Rebinder discovered many of these phenomena, provided interesting theoretical interpretations, and finally applied them to technology, thus facilitating and expediting the working of metals and drilling of hard rock. Mention should also be made of the pioneer work of Derigin on the theory of the lubricating effect of a layer of liquid between frictional surfaces, of his theory of the stability of colloids, and his work on radius action of molecular forces in thin layers of liquid.

Noteworthy, too, is the work of Grebenshchikov on reactions in fine layers of surfaces of solid bodies, and its brilliant practical application in speeding up polishing of optical glass and metal.

Extensive researches of the Soviet scientists Rabinovich, Dumansky, Kargin, Shalnikov, and others in colloidal chemistry have helped no little to promote its progress.

Such in its main outline is the path of development of Soviet physical chemistry during the 25 years' existence of the Soviet state.

Over a year ago our country was the victim of attack by a treacherous enemy, who is trying to turn the whole world back to days of barbarism and reduce all freedom-loving nations to slavery. This attack has interrupted our peaceful constructive work. Soviet physical chemists who are not at the front are, like all our people, devoting all their efforts, experience, and knowledge to speeding up our industry and perfecting the armament of our heroic Red Army, in whose ranks many of our young scientists are fighting.

We are confident that our colleagues in America and Great Britain are doing likewise and we believe that the hour is not far off when by a crushing blow at Fascism the enemy will be destroyed and mankind will enter on a new and flourishing era of science and culture.

NIKOLAI SEMENOV
Member of the Academy of Sciences of the U. S. S. R.

Rubber Products from South America

GROWTH of rubber manufacturing capacity in the other Americas in the past decade is emphasized in a recent contract by the United States for purchase from Brazil of an unspecified amount of rubber goods. Brazil has three tire factories with sufficient capacity to allow some surplus for the export market and may be able to cover minimum needs of neighboring countries like Bolivia, Chile, Uruguay, Paraguay, Argentina, and Peru. Argentina has three tire factories, but no rubber of her own. In all there are 12 tire factories in the other Americas, as well as a number of other rubber goods factories, and additional plants are projected or under construction.

Substitutes Found for Scarce Medicinals

VARIOUS substitutes have been devised to meet the scarcity or complete lack of important medicinals and related products in France, according to a report to the Department of Commerce. Cod liver oil is replaced by tunny liver oil under the guise of chocolate sweets. Mercurochrome supplants iodine, and derivatives of oleaginous plants take the place of vaseline. Sterilized cotton and gauze are made from rayon. Experts are also trying to discover substitutes for certain other natural products, such as mustard powder.

Chemical Found to Retard Bread Mold

CANADIAN experiments have shown that sodium proprionate retards mold in wartime bread made from a flour containing larger amounts of wheat germ than the white flour normally used. The chemical does not alter the flavor, quality, or appearance of the bread. Tests have shown that mold in butter and cheese is retarded when wrappers are impregnated with sodium proprionate.

Synthetic Camphor Produced in India

SYNTHETIC camphor is being made in Madras by Deccan Chemicals, Ltd., according to an unofficial report to the Commerce Department. This company was incorporated in July 1940 as a private firm but has recently been reorganized into a public company, with a capital of 500,000 rupees. The company plans to increase the capacity of its Madras plant, which is equipped for the manufacture of acetic and hydrochloric acids as well as synthetic camphor, and to build an additional factory in Bombay.

Paraguay Exports Surplus Alcohol

PARAGUAY uses considerable quantities of alcohol as motor fuel and exports that product to both Argentina and Uruguay. With her own alcohol needs supplied, Paraguay last year exported a total of 201,941 liters, of which 119,659 went to Argentina and 82,282 to Uruguay. The government at Asuncion is interested in the further development of the local alcohol industry, but has been unable to obtain priorities covering necessary equipment.

Supplemental Swedish-Danish Trade Agreement for the Year 1942

UNDER the terms of a supplement to the existing Swedish-Danish trade agreement for the second half of 1942, signed in October, Denmark is to make additional deliveries of 5,000 tons of sugar, 150 tons of preserved eggs, milk, preserves, and artificial honey to the amount of 7,500,000 kroner (about $1,875,000 at par) against exports of wood, paper, pulp, steel, tools, and machinery to the same amount by Sweden. In addition Sweden will supply similar goods to the amount of 5,260,000 kroner (about $1,315,000), and receive in return 2,000 tons of Danish butter.

BETWEEN September and the end of the year about 120,000 gallons of nonfreezing medicinal cod liver oil in St. Johns, Newfoundland, is expected to be offered for shipment, according to an unofficial report received by the government. There is a possibility of a further 50,000 to 100,000 gallons being available later.

PRODUCTION of caffeine citrate in India has increased owing to orders placed by the Medical Stores Department. Tea planters are now turning over tea waste to Indian firms instead of exporting it.

POTOMAC POSTSCRIPTS

WPB Activities

Phenolic Resins. An exception to the control over delivery and use of phenolic resins and phenolic resin molding compounds set up in Order M-246 is included in Amendment 1, permitting delivery and use during December of phenolic resins and phenolic resin molding compounds produced from phenol delivered in accordance with November allocations under M-27, without special authorization under M-246.

Price Regulations

Drums. A maximum price of 10 cents each for used 100-pound calcium carbide drums, which packers would like to buy back and refill again, has been established by the Office of Price Administration.

The ceiling price is for drums delivered to the purchaser and is established in Order No. 153 under Section 3 (b) of the General Maximum Price Regulation, effective November 25, 1942.

Chemicals. Adjustable pricing for sales of formaldehyde, lithopone, titanium pigments, and acetic acid has been established by the Office of Price Administration to aid sellers and buyers preferring to make long-term contracts. The adjustable pricing was effected through the issuance of amendments to four maximum price regulations, all effective December 2, 1942.

Incorporated in the amendments is a provision allowing deliveries on an open invoice if special permission is obtained from the Price Administrator. This permission can be obtained where a petition has been filed and time is needed for consideration of the application The price finally paid for the commodity delivered on an open invoice must be no higher than the maximum established after consideration of the application.

Fats and Oils. Sellers of refined soybean oil, peanut oil, and cottonseed oil for nonedible industrial purposes may advance their present ceiling prices under the fats and oils regulation by one-half cent per pound, the Office of Price Administration has ruled in Amendments 17 and 18 to Revised Price Schedule 53 (Fats and Oils), effective November 19, 1942. This increase is allowed because sellers of such oils for nonedible industrial purposes are not entitled to receive the Commodity Credit Corporation's one-half cent per pound subsidy, which is confined to those oils going into edible use. Therefore, the increased nonedible ceiling price will assure continued industrial supplies and yet will have little significance to the consumer.

Personnel Changes in Chemicals Division, WPB

APPOINTMENT of D. P. Morgan as director of the Chemicals Division has been announced by Ernest Kanzler, Director General for Operations, War Production Board. He will assume his duties immediately, releasing Dr. Reid, the former director, for his new appointment as Director of the Commodities Bureau.

Dr. Morgan came to Washington in June 1940, as group executive of the Chemicals Section, Materials Division, Advisory Commission to the Council for National Defense.

Other appointments include J. W. Raynolds, as deputy director of the Chemicals Division, W. Fletcher Twombly, as chief of the Aromatics and Intermediates Section, and Hugh Hughes, as assistant to the director of the Commodities Bureau.

Conversion of Chemical Plants Studied

THE essential need of converting plants for the increased production of critical chemicals was considered at the first meeting of the newly appointed Chemical Plant Facilities Industry Advisory Committee on November 17, in Washington. Information was sought from the committee on present facilities which might be converted to the rapid manufacture of various chemicals including ethylcellulose, ethyl alcohol, dibutylamine, diethylamine, ethylaniline, furfural, mannitol, sorbitol, monochlor benzene, phenol, thiokol, triacetin, tricresyl phosphate, triethyl phosphate, acetanilide, aluminum chloride, calcium carbide, calcium hypochlorite, dichloroethyl ether, silica gel, acrylonitrile, polyvinyl formaldehyde resins, and carbon black.

There is a need for 1,000,000 more pounds of ethylcellulose a month, the Protective Coatings Section stated, and it would like to aim at an increased production of 1,500,000 more pounds a month. The problem involved concerns equipment, since elaborate chemical autoclaves are necessary for the production of ethylcellulose, and these have been made of nickel to resist chemical corrosion. It was suggested by the committee that silver might be substituted for nickel, since it is not as critical a material, and might possess adequate resistance to the process. The committee also considered the problem of an increased production of ethylchloride for ethylcellulose and advised the Chemicals Division that in its opinion this problem could be solved satisfactorily.

The committee will act as the representative for the entire chemical industry in advising the Chemicals Division of the War Production Board on problems of chemical manufacture. A primary consideration will be the concentration of present facilities wherever possible in an attempt to conserve money, materials, manpower, and time.

New Advisory Committees Announced by WPB

THE following new industry advisory committees have been announced by the War Production Board:

ARSENICAL INSECTICIDES MANUFACTURERS INDUSTRY ADVISORY COMMITTEE. Hallam Boyd, Commercial Chemical Co.; J. B. Cary, Niagara Sprayer & Chemical Co.; J. A. Cavanagh, Dow Chemical Co.; H. C. Davies, California Spray Chemical Corp.; J. M. Fountain, Cotten Poisons, Inc.; J. J. Haprov, Los Angeles Chemical Co.; T. H. Macormack, E. I. du Pont de Nemours & Co., Inc.; C. B. Malander, Pittsburgh Plate Glass Co.; George E. Riches, American Agricultural Chemical Co.; M. L. Somervilles, The Sherwin-Williams Co.; William Steinschneider, Ansbacher Siegle Corp.; and B. P. Webster, Chipman Chemical Co., Inc.

CHEMICAL PLANT FACILITIES INDUSTRY. James A. Lawson, government presiding officer. Arthur C. Boylston, Mallinckrodt Chemical Works; Frederick Dehls, Benzol Products Co.; Daniel S. Dinsmoor, Monsanto Chemical Co.; William T. Haebler, Van Ameringen-Haebler, Inc.; Elvin H. Killheffer, E. I. du Pont de Nemours & Co., Inc.; Frank A. Lidbury, Oldbury Electrochemical Co.; Frederick G. Zinsser, Zinsser & Co., Inc.; Harry B. McClure, Carbide & Carbon Chemical Corp.; Thomas H. Roberts, Arnold, Hoffman & Co., Inc.; Harold L. Simmons, Harold L. Simmons, Inc.; Seymour J. Spitz, New Port Industries, Inc.; Robert Trubek, Trubek Laboratories, Inc.; and M. C. Whitaker, American Cyanamid Co.

ETHYLENE DICHLORIDE INDUSTRY ADVISORY COMMITTEE. John C. Leppart, government presiding officer. Glen Haskell, U. S. Industrial Alcohol Co.; J. W. McLaughlin, Carbide & Carbon Chemicals Corp.; Leland I. Doan, Dow Chemical Co.; and J. H. Schaefer, Ethyl Corp.

Allocations of Chemicals Announced by WPB

OVER $50,000,000 worth of scarce chemicals were allocated to industry for use in November, the Chemicals Division of WPB has announced in its second monthly report on allocations of individual chemicals. The allocations reported do not include direct military needs.

This report lists each chemical and states the percentage of requests allowed for each use. Allocations are on an end-use basis, and these percentages represent requests made for allocation, and not the percentage of requirements. Wherever limitation orders govern, requests for allocations are made in accordance with the percentage of each chemical permitted to be used by such order. The allocation report lists uses which were filled com-

SCARCE PLASTICIZERS

To extend the allotted quantities of the now-scarce plasticizers such as castor oil (raw or blown), dibutyl phthalate, tricresyl phosphate, and so forth —as well as to replace them entirely for uses to which they may not be allocated— industrial America is turning to Hercolyn.*

This high-boiling liquid resin—the hydrogenated methyl ester of pale wood rosin —has been used for years by manufacturers of lacquers and coated textiles when they wanted good "build" or body, high gloss, maximum alkali resistance, or greatest development of pigment color in the film.

Hercolyn can be intelligently applied as an extender in the more critical uses, or as a complete replacement where the final degree of service life is not demanded. Some of these new uses will last, frankly, only for the duration. Others will prove so acceptable as to remain even when current shortages have disappeared.

Write for complete information.

HERCULES POWDER COMPANY
Incorporated

Potomac Postscripts

CONTINUED FROM PAGE 1578

pletely, partially filled, and totally denied. It reflects situations in which applications are denied to encourage industry to substitute less critical materials.

This report does not indicate total requirements, since applications are made in accordance with restrictions on use imposed by various limitation orders, and with an awareness of current supply, so that requests are usually pared down to approximate the supply situation. Copies of the report may be procured from the WPB Office of War Information, Washington, D. C.

Alien Property Custodian Controls U. S. Patents

All transactions between private persons or companies involving U. S. patents and copyrights are now subject to control by Leo T. Crowley, Alien Property Custodian. Formerly this control rested in the Treasury Department. All patent applications, assignments, licenses, and other agreements affecting foreign-owned patents are included in the controls.

The Custodian has issued three general orders, 11, 12, and 13, and supplementary regulations, setting up a complete regulatory system for transactions that are subject to his control. An exception from the prohibitions of the orders is made in the case of persons residing in this country on December 7, 1941. Therefore, enemy nationals who are resident in this country, many of whom have long been employed in large research laboratories in legitimate capacities, will be free to deal with their inventions as they wish.

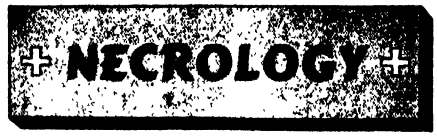
A regulation issued under General Order 11 authorizes on certain conditions transactions forbidden by the order. Thus the filing and prosecution of patent and trademark applications and the receipt of letters, patent, and trademark registrations are permitted provided the applicant, assignee, or attorney attach to the first paper filed a report of certain information regarding the application.

Dow Chemical to Construct Plant in Texas

Secretary of Commerce Jesse Jones, has announced that Defense Plant Corporation, RFC subsidiary, has authorized execution of a contract with the Dow Chemical Co., Midland, Mich., to provide for the construction and equipment of a plant in Texas, at a cost in excess of $2,500,000. These facilities will be operated by the Dow Chemical Co., and title will remain in Defense Plant Corporation.

Cylinder Conservation Stressed by WPB

Manufacturers and distributors of compressed gases were commended by Donald M. Nelson, chairman of the WPB, for their efforts to conserve steel cylinders for compressed gases and urged to still greater effort in a letter distributed to the Oxygen and Acetylene Industry Advisory Committee at a meeting on November 17, in Washington.



Stressing the vital part compressed gases play in the war production program, Mr. Nelson pointed out that the shortage of cylinders for compressed gases is so serious that it appears there will be no additional cylinders made available to the oxygen and acetylene industry during 1943, despite increasing demands, because of heavy demands of military forces outside the country for all production.

A considerable expansion of oxygen production facilities now under way indicates there will be no serious deficiency of oxygen for war purposes and hydrogen production seems generally adequate for war purposes. However, increasing demands for acetylene have placed this commodity in a more precarious position.

The shortage of steel is leading to a necessary re-use of calcium carbide drums, and industry is making every effort to re-use single-trip containers. The industry also is installing acetylene generators at plants which use acetylene, and piping the gas through the yard, further reducing the use of cylinders.

Transportation of Explosives

The Interstate Commerce Commission on October 28, 1942, issued Order 3666, superseding and amending previously published orders of August 16, 1940, November 8, 1941, December 18, 1941, February 26, 1942, and July 14, 1942, having to do with the transportation of explosives.

Clyde Coleman

Clyde Coleman, research chemist for the United States Rubber Co., died in Hohokus, N. J., on November 6 at the age of 59.

Dr. Coleman was born in Galesburg, Ill., received the B.S. degree from Williams College and the Ph.D. from the University of Chicago. Before entering the employ of U. S. Rubber he had worked for E. I. du Pont de Nemours & Co., Inc., and had been manager of the New Brunswick plant of E. R. Squibb & Sons. During the first World War he developed processes for making toluene and dyes. He joined the American Chemical Society in 1935.

Winfield Scott

Winfield Scott, rubber chemist and past Chairman of the Akron Section of the American Chemical Society, died November 19.

Mr. Scott was born in Senecaville, Ohio, December 14, 1887, and was graduated from Oberlin College with an A.B. degree and from the University of Washington with a master's degree. During the first World War he was sent to the Goodyear Tire and Rubber Co. to do war work, and remained there until 1920, when he went to the Quaker City Rubber Co. in Philadelphia as a compounder. From 1922 to 1924 he was in the Rubber Chemicals Division of E. I. du Pont de Nemours & Co., Inc., and from 1924 to 1929 did research work at The Rubber Service Laboratories. In 1933 he became vice president of the Kavalco Products Co., returning in 1933 to the Research Division of the Goodyear Tire and Rubber Co.

Mr. Scott had written numerous articles on vulcanization accelerators and antioxidants, and held many patents on such compounds. He was considered an authority on the theory of vulcanisation. He was a member of the American Chemical Society, which he joined in 1919, of the American Institute of Chemical Engineers, and the Franklin Club.

Samuel A. S. Strahan

Samuel A. S. Strahan, professor of organic chemistry, died suddenly on November 15 in Woburn, Mass., as the result of a heart ailment.

Professor Strahan was born in Everett, Mass., May 11, 1881, and studied at Massachusetts Institute of Technology where he became an assistant instructor for a short time. In 1917 he served as instructor of chemistry and later as professor of chemistry and chairman of the department at Northeastern University, Boston, Mass. In 1938, owing to ill health, he relinquished his administrative duties but continued his teaching until his death.

Professor Strahan was a member of the American Chemical Society, and the Society for the Promotion of Engineering Education.

William T. Sturges

William T. Sturges, assistant to the director of the Lederle Laboratories, Pearl River, N. Y., died November 17 at the age of 56. Mr. Sturges had been employed by the Lederle Laboratories since 1927, having been superintendent and manager of the laboratories before appointment last year as assistant to the director.

How to Feed a Battleship!

TODAY, battleships refuel and get back on the job faster . . . hundreds of cargo ships are "turning around" in port more quickly because, several years ago, Thiokol* synthetic rubber supplied the key to constructing smooth-bore, oil-loading hose. In this hose America's pioneer synthetic is used as the silk-smooth inner liner which eliminates turbulence, cuts friction between oil and hose to the bone. The rate-of-flow through hose with a Thiokol liner is much higher than with the older types.

Thiokol synthetic rubbers have improved oil-loading hose in many other ways. Previous types necessarily embodied oil-vulnerable, natural rubber liner reenforced with heavy metal bands. The use of flexible, oil-proof Thiokol synthetic rubber removed these disadvantages, decreased weight, increased ease of handling and provided a far longer hose life.

An engineering material proved many years before Pearl Harbor, Thiokol synthetic rubber is helping us wage successful war on land, sea and in the air. Much new technical data on forms and applications of this synthetic have been amassed by our research and development staff. If your work is war work, ask for it.

NEWS-MAKERS

Walter D. Albert, professor of chemistry at the Eastern Illinois State Teachers College, has been elected to a position on the science staff of the Slippery Rock State Teachers College, Slippery Rock, Penna.

D. L. Beeman has been appointed engineer, Industrial Power Section, General Electric Co., succeeding **E. G. Merrick;** and **R. S. Sage** has been made engineer, Mining Section, succeeding **F. L. Stone.** Mr. Merrick and Mr. Stone will continue service with the company with specially assigned duties and as engineering consultants.

Fitzhugh W. Boggs is now a research engineer at the laboratories of the Westinghouse Electric and Manufacturing Co., East Pittsburgh, Penna. **Elizabeth M. Boggs** is a lecturer in the Department of Physics, University of Pittsburgh.

M. C. Brockmann is now connected with Joseph E. Seagram & Sons, Inc., Louisville, Ky., and is supervisor of the Alcoholic Division in the Research and Development Department. He was previously research chemist for Hiram Walker and Sons, Inc.

Harold P. Brown has resigned his position as chairman of the Chemistry Department, University of Kansas City, to enter the employ of the Synthetic Rubber Division, B. F. Goodrich Rubber Co., Research Laboratories, Akron, Ohio.

Edward S. Coe, Jr., has been appointed manager of the New York office of the Farrel-Birmingham Co. He has been with the company since 1936.

Lloyd M. Cooke, formerly lecturer and research associate, Division of Industrial and Cellulose Chemistry, McGill University, has become a member of the research staff of the Corn Products Refining Co., Argo, Ill.

Virginia J. Dusold is now head of the Chemistry and Mathematics Departments, Cottey Junior College, Nevada, Mo. She was formerly medical chemist at the Milwaukee-Children's Hospital.

P. L. Fahrney has recently been elected president of the American Bitumuls Co., San Francisco, Calif.

Seymour Faulkner has joined the staff of the Girdler Corp., Louisville, Ky., to direct the development and further the sales of new processes and catalysts to be used in the gas, chemical, and other fields. Prior to 1941 Mr. Faulkner was associated with The Procter and Gamble Co., Cincinnati, Ohio, for more than 15 years. **J. Earl Taylor,** formerly with the Research Department, Procter and Gamble Co., is now with The Girdler Corp. in charge of a research group. **A. A. Azar,** formerly with the Koppers Co., Bartlett-Hayward Division, has joined the engineering staff of Girdler.

Seymour Faulkner

Lewis Fowler has left his position as chemist at the Portland, Ore., mill of the Archer-Daniels-Midland Co. to accept a place with the Puget Sound Navy Yard, Bremerton, Wash., as assistant chemist.

Lieutenant Frank B. Freese has been on active duty for six months as a first lieutenant in the United States Marine Corps, part of the time on temporary duty with the Royal Air Force. He is now in command of the 1st Marine Company, Marine Aviation Detachment, at Corpus Christi, Tex., and is instructor at the Naval Training School there. He has been granted leave of absence by the American Chemical Paint Co. for this activity.

Milton Green has left the Burroughs Wellcome Co. and is now associated with the Hoffmann–LaRoche Co., Nutley, N. J., as a research chemist in their synthetic organic department.

Charles H. Grimm, for many years connected with the laboratories of Fritzsche Bros., Inc., New York, has taken a position as technical supervisor and chief chemist of Lenthéric, Inc., Brooklyn, N. Y.

Edwin E. Hays, who received the Ph.D. degree in biochemistry at the University of Chicago in March, has accepted an instructorship in biochemistry at the St. Louis University School of Medicine. Until September he was research assistant in biochemistry on the Armour & Co. fund at the University of Chicago.

G. F. Hogg, manager of the Naval Stores Department in the Chicago office of the Hercules Powder Co., has been made technical assistant superintendent of the plant at Hercules, Calif. **L. P. Killilea** will replace Mr. Hogg in Chicago. **Robert L. Skov** has been transferred to the Engineering Department at Hercules, Calif.

Arthur D. Holmes, for 21 years director of research for the E. L. Patch Co., Stoneham, Mass., has resigned to accept an appointment as research professor of chemistry at the Massachusetts State College and Agricultural Experiment Station, Amherst, Mass. **Mrs. Holmes,** formerly Julia B. Outhouse, professor of nutrition at the University of Illinois, has been appointed research professor of nutrition at the Massachusetts State College.

B. J. Humphrey has joined the staff of the Connecticut Hard Rubber Co., New Haven, Conn., as assistant director of research. For the past 12 years he was in the Research Laboratory of the Firestone Tire & Rubber Co., Akron, Ohio.

Frank H. Hurley, Jr., Department of Chemistry, The Rice Institute, is teaching this year at Reed College. Dr. Hurley went to Reed to fill the gap created by the appointment of **Arthur F. Scott,** head of the Department of Chemistry, to the acting presidency of the college.

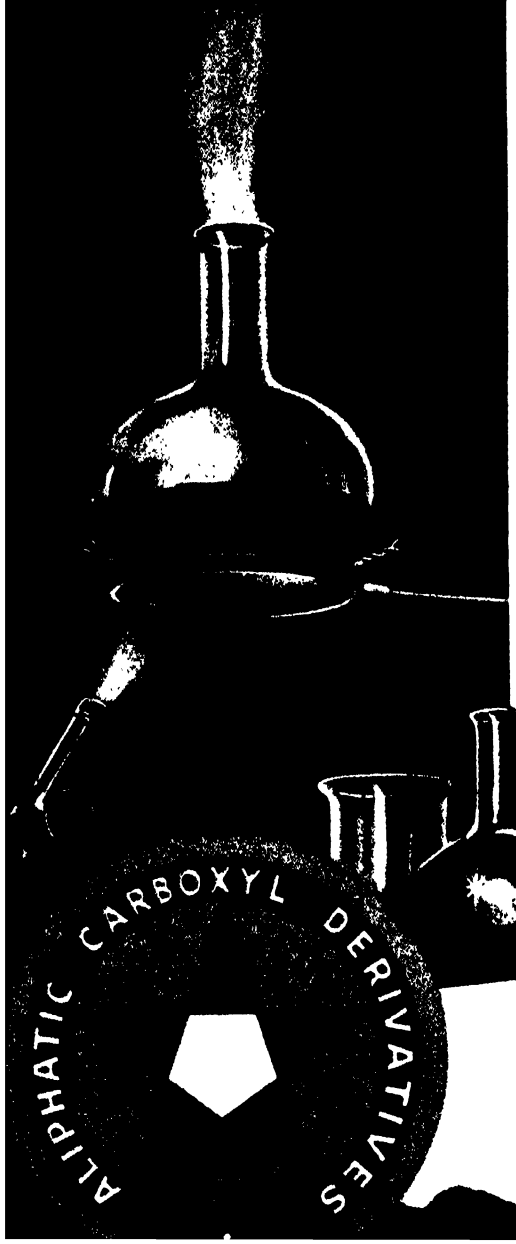
Captain Sidney Kaye is now with an Army Medical Laboratory in charge of chemistry and toxicology and can be reached at the Puerto Rican Department Laboratory, San Juan, P. R. He was formerly with New York University.

William B. Plummer, manager of the Development and Patent Department, Standard Oil Co. of Indiana, has been commissioned as a lieutenant-colonel in the United States Army for special duty in the office of the Under Secretary of War. While he is on leave of absence **Pike H. Sullivan,** assistant manager of the department, will act as manager.

FOUNDATION-STONE OF TOMORROW'S DISCOVERIES

Commercial Productions of Really High Molecular Weight Normal Aliphatic Primary, Secondary and Tertiary Amines, Ranging from 6 to 54 Carbon Atoms, for Your Research on THE SHAPE OF THINGS TO COME.

This foundation-stone of tomorrow's goods is available in tank car quantities for chemical synthesis on a production scale . . . TODAY.



Primary amines are already serving in the synthesis of detergents ...wetting out agents...petroleum emulsion breakers...dye assistants ...emulsifiers...insecticide spreaders...waterproofing chemicals.

Without being changed by synthesis, they are finding wide acceptance in such diverse fields as powerful germicides . . . fungicides . . . algaecides...collectors in the concentration of phosphate...potash... mica...lepidolite...magnesite...gasoline stabilization...anti-tack agents...dispersing agents...synthetic rubber compounding...flocculating agents.

Of more vital importance will be your research into their future uses.

Current production is limited to 5 members of each series having 16 and 18 carbon atoms, except on high-ranking priority-rated orders.

We suggest that you write for further, complete information on these really high molecular weight amines and fit them into your plans for today . . . and tomorrow.

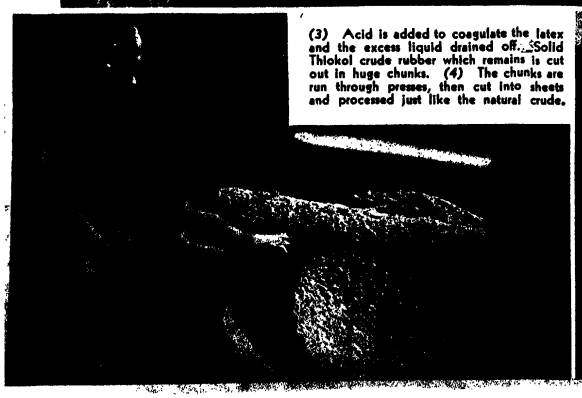
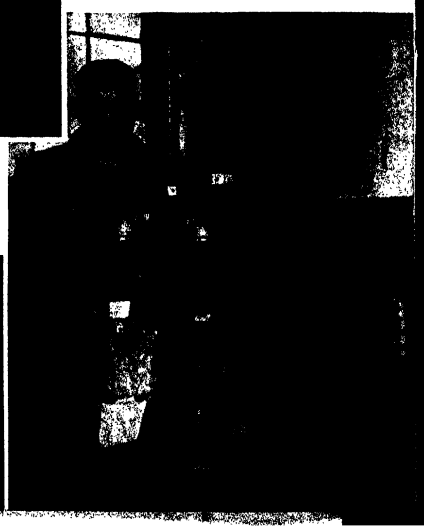
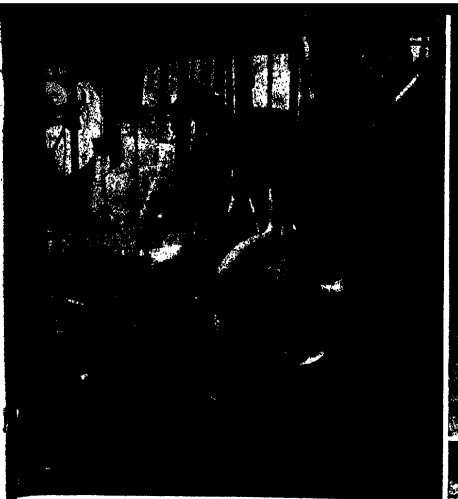
NEWS PARADE



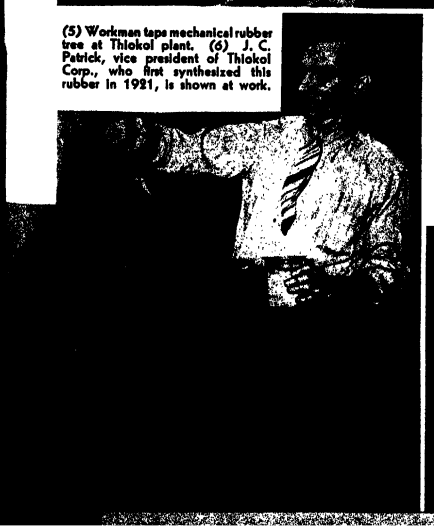
(See also "Thiokol", page 1362, Nov. 10, 1942 issue)





America's oldest synthetic rubber is produced at the plant of the Thiokol Corp. in Trenton, N. J., where it is rapidly manufactured from noncritical sulfur and salt. *(1)* Retreader applies Thiokol camelback to tire carcass. *(2)* The first step in making Thiokol synthetic rubber is to add sodium polysulfide to ethylene dichloride in a huge vat of iron, wood, or cement. The two compounds combine to form a milky fluid.

(3) Acid is added to coagulate the latex and the excess liquid drained off. Solid Thiokol crude rubber which remains is cut out in huge chunks. *(4)* The chunks are run through presses, then cut into sheets and processed just like the natural crude.



(5) Workman taps mechanical rubber tree at Thiokol plant. *(6)* J. C. Patrick, vice president of Thiokol Corp., who first synthesized this rubber in 1921, is shown at work.

(7) Self-sealing gas tank in Douglas bomber has inner layer of Thiokol and jacket of Thiokol-impregnated fabric. *(8)* J. C. Patrick beside car with first Thiokol retreads. *(9)* Mareng cell made from Thiokol is used to convert box cars into tank cars. *(10)* Two coats of Thiokol add 700 miles to tire life. *(11)* Stanley I. Mason, Jr. left, receives rationing certificate from Walter Lochner of Trenton Chamber of Commerce for first synthetic retread in country given civilian war worker by rationing board. Tire is retreaded with Thiokol.

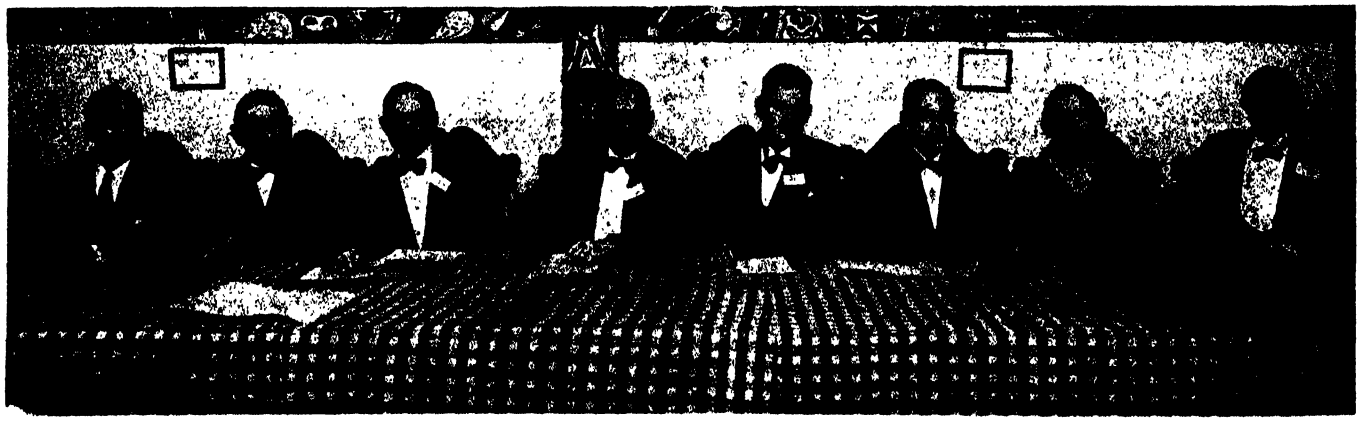
GEORGE NELIDOFF



Dr. and Mrs. Vladimir N. Ipatieff

Montreal Section, Rubber and Plastics Division, Society of Chemical Industry

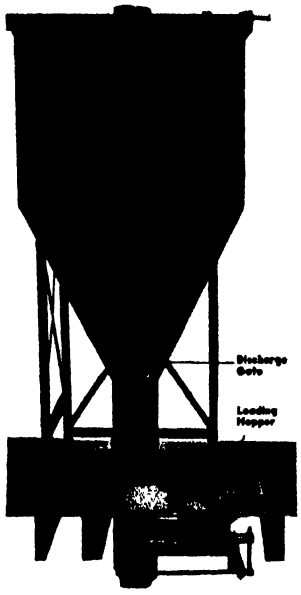
THE Montreal Section, Rubber and Plastics Division, Society of Chemical Industry, was addressed on November 13 by A. E. Byrne, who discussed the chemical derivation of plastics and described glyptal resins.

On December 16 there will be a joint meeting with the Montreal Section, Society of Chemical Industry, at the Ritz Carlton Hotel. H. I. Cramer, Sharples Chemicals, Inc., will speak on synthetic rubber.

Wilmer T. Rinehart, who was recently associated with the United States Gypsum Co. and formerly with the Roessler & Hasslacker Chemical Co. at Niagara Falls, N. Y., has joined the Chemical Engineering staff of the Armour Research Foundation.

Chicago Honors Chemist

Speakers' table at banquet of the Chicago chapter, American Institute of Chemists, November 20, in honor of Vladimir N. Ipatieff. *Left to right.* J. G. Alther, vice president, Universal Oil Products Co.; H. J. Halle, president, Universal Oil Products Co.; Gustav Egloff; Frank C. Whitmore; Vandeveer Voorhees; Ipatieff; Mrs. Ipatieff; and Ward V. Evans. [Story, CHEM. ENG. NEWS, 20, 1532 (Nov. 25, 1942).]



Ion-Exchange Resins

THERE is scarcely a major industry in the United States in which there are not applications for the newly developed synthetic ion-exchange resins, according to Robert J. Myers, of the Resinous Products and Chemical Co. Laboratories, Philadelphia. Speaking before the Western New York Section of the AMERICAN CHEMICAL SOCIETY in Buffalo on November 17, Dr. Myers declared that though the ion-exchange resins have found their biggest practical use in water-conditioning and softening, many special new applications are now in the development stage.

"Desalting" aqueous solutions of carbohydrates, with an increased sucrose yield from cane and beet sugar sirup, is an outstanding application of the resins. Aqueous solutions of formaldehyde, gelatin, etc., may likewise be desalted.

The exchange capacity depends more on chemical constitution than on mere composition. The resins can be used as selective adsorbents in columns where chromatographic banding occurs. Their more flexible structure means lower attrition losses. Experiments prove that there is no appreciable decrease in capacity as the number of cycles is increased.

The advent of the synthetic ion-exchange resins makes it possible for the first time to remove all dissolved salts from water and other aqueous solutions by chemical reaction alone. Water so produced is comparable in quality and purity to laboratory distilled water.

The

VERTICAL BATCH MIXER

as

"APPLICATION DESIGNED"
by Sprout, Waldron is:

IDEAL — for mixing any free flowing, powdery, granular material.

AVAILABLE — in a number of different styles and sizes.

ECONOMICAL — of floor space and power.

FABRICATED — of special materials to meet your individual requirements.

OBTAINABLE — in styles requiring a minimum investment.

VERSATILE — fills requirements that no other type of mixer will meet.

FILLS REQUIREMENTS — where all other mixers fall short and has a definite place in the chemical industry.

The vertical mixer lends itself particularly to problems involving the loading and unloading of the machine. It is a self contained unit — ingredients are dumped into the hopper at floor level and the mixed product can be drawn off directly from the mixer into bags or barrels.

Send us details of your requirements.

Officers of American Petroleum Institute

AT THE 23rd annual meeting of the American Petroleum Institute, held in Chicago on November 11, the officers were reelected for 1943. President, William R. Boyd, Jr.; vice president for production, George A. Hill, Jr.; vice president for refining, J. Howard Pew; vice president for marketing, E. V. Weber; treasurer, O. D. Donnell; secretary and assistant treasurer, Lacey Walker.

A. A. A. S. Meeting Postponed

AT THE request of the Office of Defense Transportation, the American Association for the Advancement of Science has indefinitely postponed the meeting that was scheduled to take place the week of December 28 in New York City.

AT A recent meeting of the Western Vermont Section of the AMERICAN CHEMICAL SOCIETY the following officers were elected for the coming year:

Chairman, F. S. Quinlan, St. Michael's College; *Chairman-Elect*, H. B. Pierce, University of Vermont; *Secretary-Treasurer*, Constance L. Brown, University of Vermont; *Councilor*, Prof. E. B. Womack, Middlebury College.

Institute of Agricultural Sciences Established

THE cooperative program of the Americas for development of Western Hemisphere resources will be facilitated by the establishment of the Inter-American Institute of Agricultural Sciences, designed to function as an aid to continental research and experiment stations for agricultural science in the American republics. Earl N. Bressman has been named director and Jose L. Colom, chief of the Division of Agricultural Cooperation of the Pan American Union, has been named secretary. Costa Rica has been recommended as a proposed site and accepted by the governing board. The preliminary planning was done by an inter-American committee on tropical agriculture, headed by Hector David Castro, Minister to the United States from El Salvador.

Neil F. Robertson, formerly with the Scott Paper Co., Chester, Penna., and the Pulp Bleaching Co., Wausau, Wis., has accepted a position in the Research Laboratory of the Crossett Lumber Co., Crossett, Ark., where he will work in the pulp and paper division.

. . . BUILD DURABLE CORROSION-RESISTANT EQUIPMENT with PENCHLOR ACID-PROOF CEMENT

REG. U. S. PAT. OFF.

Quick-setting • Self-hardening

Wartime needs demand time-saving wherever possible in acid-proof construction. Wartime pressure for the utmost in production means that corrosion-resistant construction *must* stand up. Penchlor Acid-Proof Cement meets both these requirements with a record of proved performance.

With Penchlor Acid-Proof Cement you can get brick-lined equipment into service without delay because this tough, long-lasting sodium silicate cement offers these advantages: Quick-setting and self-hardening—easily handled—no heating required—no drying delays—no acid treatment.

Continuous production is possible because Penchlor Acid-Proof Cement has proved itself in years of uninterrupted service. Great strength and minimum porosity reduce repairs to a minimum. The mortar set is permanent. There is less shrinkage with Penchlor Acid-Proof Cement. It is steam and water resistant. It adheres well to a wide variety of construction materials.

Industries Using Penchlor Acid-Proof Cement

Acids	Explosive	Pulp
Alum	Fertilizer	Rayon
Bleaching and Dyeing	Glass	Rubber
Chemical	Lacquer	Smelting
Coke and Gas	Leather	Spark Plugs
Distilling	Metal Pickling	Steel
Electrochemical	Oil	Tanning
Electroplating	Paper and Parchment	Textile

Where conditions require a cement of unusual strength and high resistance to abrasion, consider these Penn Salt *resin* cements: *Asplit**, for conditions always acid . . . *Causplit**, for alternate acid and alkaline conditions. These are easy to handle and will withstand a wide range of corrosive conditions up to 350 degrees F.

Check these MULTICLONE

CAST IRON TUBE ADVANTAGES

1. In these days of restricted steel production, cast tubes permit a wide range of alloy procurement to suit individual requirements. They can be custom tailored locally to the problem in the desired quantities; whereas plate requires mill run quantities with resultant delays and often unpredictable delivery.
2. Cast tubes are more wear-resistant.
3. Cast tubes are more corrosion-resistant.
4. Cast tubes are more erosion-resistant.
5. Cast tubes under wide ranges of temperature change are less subject to deformation.
6. In the Multiclone with cast tubes, individual tubes can be removed without dismantling the entire installation thus reducing shut down time to a matter of minutes rather than hours or days.
7. Cast Iron tubes can be shipped knocked down and be assembled on the job without welding.

Machining Alcoa Aluminum

A 44-PAGE book on "Machining Alcoa Aluminum", produced by the Aluminum Co. of America, Pittsburgh, Penna., sets forth the general principles of machining aluminum and its alloys; suggests speeds, feeds, and depths of cut which will produce satisfactory results; points out where practices and tools common to other methods may be used; and indicates where special practices or tools are desirable. Copies are available from the company without charge.

FOR VICTORY TODAY AND SOUND BUSINESS TOMORROW

Get This Flag Flying Now!

This War Savings Flag which flies today over companies, large and small, all across the land means *business.* It means, first, that 10% of the company's gross pay roll is being invested in War Bonds by the workers voluntarily.

It also means that the employees of all these companies are doing their part for Victory . . . by helping to buy the guns, tanks, and planes that America and her allies *must* have to win.

It means that billions of dollars are being diverted from "bidding" for the constantly shrinking stock of goods available, thus putting a brake on inflation. And it means that billions of dollars will be held in readiness for post-war readjustment.

Think what 10% of the national income, saved in War Bonds now, month after month, can buy when the war ends!

For Victory today . . . and prosperity *tomorrow,* keep the War Bond Pay-roll Savings Plan rolling in *your* firm. Get that flag flying now! Your State War Savings Staff Administrator will gladly explain how you may do so.

If your firm has not already installed the Payroll Savings Plan, *now is the time to do so.* For full details, plus samples of result-getting literature and promotional helps, write or wire: War Savings Staff, Section F, Treasury Department, 709 Twelfth Street NW., Washington, D. C.

This Space Is a Contribution to America's All-Out War Program by

CHEMICAL AND ENGINEERING NEWS

Outlines of Food Technology. *Harry W. von Loesecke.* 1st ed. 505 pages. Reinhold Publishing Corp., 330 West 42nd St., New York, N. Y. 1942. Price, $7.00.

IN THE words of the Preface, "the purpose of this book is to outline the processes used in the modern food industry. No attempt has been made to give detailed descriptions of the preparation of the different food materials * * *. As an aid to those desiring further information pertaining to any particular field, a list of suggested readings is appended to each chapter. These are by no means complete, but include those references which are considered most important * * *. The nutritional value of the different foods has not been discussed * * *. Statistical data have been kept to a minimum. . . ."

The field covered can best be indicated briefly by listing the chapter headings: The Tin Can and Glass Container; Fruits and Their Products; Canning of Vegetables; Dairy Products; Meat, Meat Products, and Poultry; Fish and Shellfish; Grains and Their Products; Edible Fats and Oils; Sugars and Starches; Nuts; Spices, Relishes, Essential Oils, and Extracts; Beverages; Confectionery, Jams, Jellies, Preserves, and Certified Dyes; Storage and Marketing of Fruits and Vegetables; Preservation of Foods by Freezing.

Some errors have been noticed. On page 23, the obsolete term "calcia" is used for "high calcium limestone or burned lime". On page 38 it is said that "the Pure Food and Drugs Act defines cider or apple vinegar as * * *". This act did not define any food stuffs. On page 163 it is said that "evaporated milk * * * contains not less than 7.9 per cent of milk fat, nor less than 25.9 per cent of total milk solids; provided, however, that the sum of the percentages of milk fat and total solids be not less than 33.7 per cent". The advisory standard of identity for evaporated milk which was effective under the Food and Drugs Act of June 30, 1906, required that the evaporated milk contain not less than 7.8 per cent (not 7.9 per cent) and not less than 25.5 per cent of total milk solids (not 25.9 per cent), the sum of these to be not less than 33.7 per cent. Probably the author has confused this with the evaporated milk standard set forth in the *Federal Register* of July 2, 1940, issued under the Food, Drug, and Cosmetic Act, wherein it is stated that evaporated milk must contain not less than 7.9 per cent of milk fat and not less than 25.9 per cent of total milk solids, but there is no requirement for the sum of these.

Irradiated evaporated milk is described (page 165) as being made from irradiated whole milk by concentration. As a rule it is the concentrated milk which is irradiated and not the whole milk prior to concentration. In the discussion of baking powder (page 261) it is stated that "some baking powders also contain small amounts (about 0.15 per cent) of albumen in the form of dry egg white". As a

CONTINUED ON PAGE 1594

PURE ENOUGH TO DRINK...

but Unfit for Industrial Use!

Water, clear and sparkling from a mountain lake, may be perfectly potable in its natural state, yet without chemical treatment will be altogether unsuitable for boiler feed. Water demands of industry are sometimes more exacting than those of the human system.

Any water from lake or river requires study and treatment before being used as an industrial water. Thus, the accurate and continuous conditioning of boiler feed-water will reduce boiler outages caused by scale, corrosion and carryover . . . outages requiring costly repairs and resulting in loss of production.

Boiler outages can be prevented through the supervisory services of W. H. & L. D. Betz. Here is an organization of engineers and chemists, trained to handle all problems relating to boiler, cooling and process water—industrial waste and sewage disposal.

LABORATORIES AND ENGINEERS LOCATED THROUGHOUT U. S. A. AND CANADA

With your new chemical problems ——

The conversion of a plant to war production creates a need for unfamiliar chemicals and unaccustomed processes...when you make the change-over you can secure those chemicals from Harshaw...even the common garden variety—this is a good thing to know when you have the thousand and one headaches involved in such a change—more than that, you can count on technical assistance and information, for Harshaw's business is industry-wide, distribution and service facilities nation-wide—inquiries will have executive attention

—— Harshaw can probably help

Official Navy Photo

"Jap Slappers!"

NAVY MEN CALL THEM "P. T. BOATS"

Small, light and with an amazing amount of speed, the famed "P. T. Boats" can outmaneuver any destroyer, cruiser or battleship the enemy has ever built. They carry a death sting in their fore and aft torpedo tubes. And for their splendid accomplishments as fighting crafts, they are the pride and joy of the Allied naval men the world over. Their worth has been admirably proven on the field of action.

Layne Pumps and Well Water Systems bear an amazing similarity to the P. T. Boats, on the points of sturdiness. First in genuine quality and second, in that they, too, have proven their worth on the field of action. These Water Systems have been designed and are being built to fulfill a tremendously important task—that of providing millions and millions of gallons of water under any and all conditions. Throughout the Nation, the name Layne is as famed in the water producing field as is the name of P. T. Boats in Naval warfare.

Hundreds and hundreds of Layne Well Water Systems are now serving army camps, naval stations, ship yards, flying fields and munitions plants. Their quality is worthy of outstanding recognition. For late catalogs, bulletins, etc., address

Beyond the Flyleaf

CONTINUED FROM PAGE 1592

matter of fact, the use of white of egg has practically disappeared from baking powders. Of all the baking powders on the market today, the reviewer knows of but one that contains egg white and in this case in amount (as stated on the label) of but 0.01 per cent.

On page 252 the author says that the Earle process is one that "would seem to dispense with the need for enriched flour * * *". It is referred to as a process of milling, which it is not. Flour from wheat cleaned by the Earle process is merely but the whole wheat berry ground to a flour but minus the outer fibrous covering or "beeswing" which constitutes but approximately 2.5 per cent of the berry. In its essential characteristics, it differs little from whole wheat flour. Experiences through the years have amply demonstrated that it is practically impossible to increase the whole wheat flour consumption much beyond 2 per cent of the total flour output. Therefore to expect the Earle process flour to replace enriched flour is to expect the impossible.

Bromated flours (page 252) are described as those to which "potassium bromide" has been added. This should read "potassium bromate".

Much of the technology of this book is sketchy. This is inevitable in the attempt to cover such a wide field in such a limited space. Use of the book, however, along with suggested readings may serve well for outlining some of the fundamental principles of food technology.

F. L. DUNLAP

Physical Science. *William F. Ehret*, Editor, and *Leslie E. Spock, Jr.*, *Walter A. Schneider*, *Carel W. van der Merwe*, and *Howard E. Wahlert*. xii + 639 pages. The Macmillan Co., 60 Fifth Ave., New York, N. Y., 1942. Price, $3.90.

IN THE final form of this book, which has evolved from that first prepared six years ago, the authors have had a definite object in view, and have done their work well. All are teachers in Washington Square College of Arts and Science, New York University.

The Preface states: "Matter is here viewed through the eyes of the astronomer, chemist, geologist, mathematician, and physicist". A belief in "the value of the more rigorous approach with the frequent application of mathematics" is evident. There is much valuable information, generally well arranged.

The effort to give "broadly the present state of our knowledge of the physical universe" in a composite picture has been reasonably successful. Classified arbitrarily, 12 of the 35 chapters are devoted chiefly to physics, with nine to chemistry, eight to geology, two to astronomy, and four general. This statement cannot be exact, but it does give an idea of the contents of the book.

Exercises, problems, and topics for further study are given, usually at the end of each chapter, occasionally within the chapter discussion. There are also well-chosen references to books and journal articles. In the nine chemical chapters references are made to nine journals, the *Journal of Chemical Education* containing 34 of the 51 articles and *Industrial and Engineering Chemistry* nine, including one to CHEMICAL AND ENGINEERING NEWS as late as April 25, 1942.

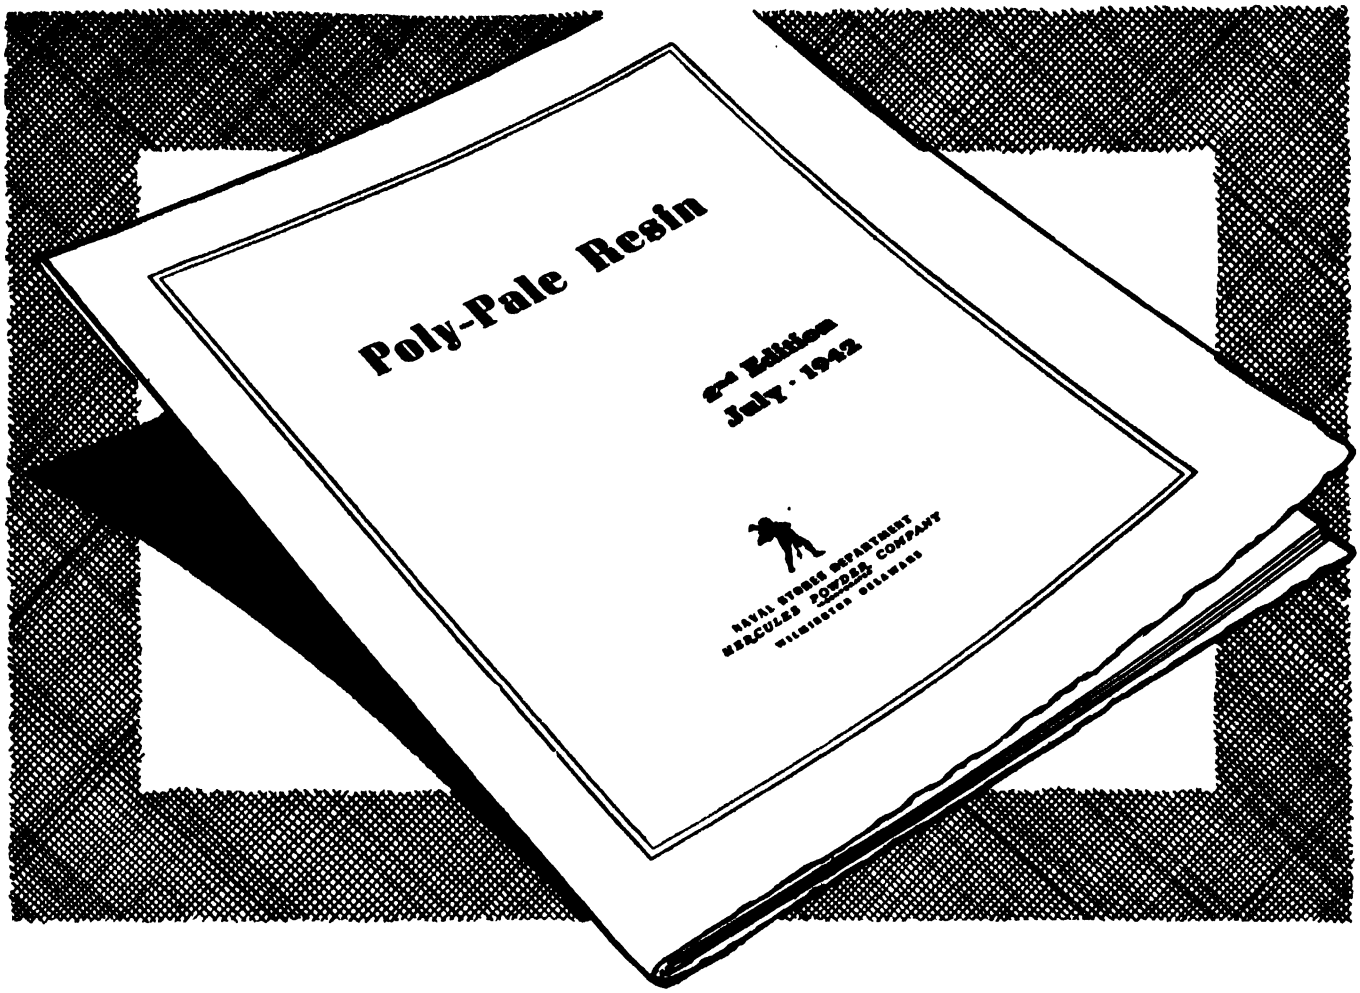
Mechanical work is excellent, and the care, which might be expected, has eliminated almost all mistakes. Very, very rarely one creeps in as "1938" for the centennial year of organic chemistry, which is obviously a typographical error.

There should be a word of warning. This excellent book should not be used by students of inferior ability, or by those who do not intend to work and to work hard.

HARRISON HALE

Textile Fiber Atlas. *Werner von Bergen* and *Walter Kraus*. 38 + vi pages, 24 plates. American Wool Handbook Co., New York, N. Y., 1942. Price $3.00.

THE purpose of this book is to present a set of photomicrographs of all important textile fibers. It is divided into the following four sections: Natural Animal Fibers; Natural Vegetable Fibers; Artificial and Synthetic Fibers; Mineral Fibers.



This book is the logical result of the practice in textile microscopy of maintaining, for comparisons, collections of typical samples of various textile fibers. For those laboratories where a complete collection is not available, this Atlas should be of great assistance. In those laboratories where fiber collections are extensive the Altas will serve as a handy reference text.

The 311 photomicrographs have been well selected to show the most marked characteristics of the different fibers. The illustrations of various types of damage occurring in wool fibers should be of particular interest to those concerned with the Wool Products Labeling Act. About half of the book is devoted to wool and minor hair fibers.

The minor hair fibers pictured include mohair, cashmere, camel, alpaca, llama, vicuna, hog bristles, goat, horse, cow, rabbit, and muskrat, with examples of beaver, raccoon, squirrel, and fox fur.

The sections on cotton and the other seed fibers, with the bast and structural fibers, are well chosen to give a ready means of differentiation between the various types.

CONTINUED ON PAGE 1596

High-Melting Non-Crystallizing... POLY-PALE RESIN

Poly-pale Resin has a melting point of 100° C., 15 to 20° C. higher than natural rosins. It is substantially free from metals. Dissolved in solvents or drying oils, it shows no tendency to crystallize. These valuable qualities are also imparted to derivatives of Poly-pale Resins, such as synthetic resins and resinates.

Other advantages over rosin are wider and more complete solubility, lower acid number, higher viscosity in solution.

Poly-pale replaces rosins advantageously, and also offers values that are unobtainable with regular rosins.

One grade of Poly-pale corresponds to WG on the rosin scale, and for processes in which this extremely light color is not required, there is an N grade.

Much valuable information for formulators is contained in a revised 2nd edition of the booklet "Poly-Pale Resin." Mail the coupon for your copy.

Niagara Falls New York

Beyond the Flyleaf

CONTINUED FROM PAGE 1594

The discussion of the artificial fibers includes not only cellulose and protein fibers, but nylon and Vinyon as well. It is rather unfortunate that the authors used the word "Prolon" for the fibers prepared from natural proteins, because this word is a registered trade mark of the Pro-phy-lac-tic Brush Co.

The comparative scale for fineness of various textile fibers is an excellent addition to the text.

A splendid bibliography is appended.

The Textile Fiber Atlas is printed on good paper and is attractive with its glazed cover and plastic binding. It is unfortunate that an otherwise valuable book should have so many typographical errors in the text. At times this makes difficult reading.

GUSTAVUS J. ESSELEN

The Pharmacopoeia of the United States of America (The United States Pharmacopoeia). 12th rev. (U. S. P. XII), official from November 1, 1942. By authority of the United States Pharmacopoeial Convention, meeting at Washington, D. C., May 14 and 15, 1940. Prepared by the Committee of Revision and published by the Board of Trustees. lxxxviii + 880 pages. Mack Printing Co., Easton, Penna., 1942. Price, $7.50.

THE U. S. Pharmacopoeia sets forth principles by which right in medical and surgical agents is defined and can be enforced and wrong is detected and can be punished legally. These principles—definitions and specifications of therapeutic and allied supplies—have been discovered beneath the husks of centuries of medical and pharmaceutical experience; they have been extracted, mastered, refined, modified, and improved by decennial pharmacopoeial revisions by specialists during the past hundred years. The revision of the U. S. Pharmacopoeia is the greatest labor of love in the realm of science. It has such wide scope and intricacy, such severe logic and nice dependencies, that it has always tasked the highest minds to reach its boundaries. Success has been attained by continuous diligent study, united with devotion and talents of superior order, and by mastery of the territory through frequent surveys of old and new landmarks.

We who know the U. S. Pharmacopoeia have reverence for it. It is a book covered with the armor of federal government authority. It is composed mainly (pp. 9–550) of precisely definite monographs on vegetable and animal drugs, chemicals, and preparations written by expert committees after thorough research; it presents the most carefully selected knowledge of official remedies. The General Notices on pp. 1–8 explain in specific fashion the purposes and limitations of the various standards throughout the work. Since its inception the Pharmacopoeia has emblemized faith, morals, and doctrine in medicine and pharmacy; it has taught the physician and the pharmacist their own individual responsibilities regarding drugs; it has given pharmacy dignity and sound professional status.

Enough has been said to show that the Pharmacopoeia is the indispensable guide of the pharmaceutical chemist and drug manufacturer. It is, however, deserving of very much broader chemical acquaintance. It is essential to the nutritionist and bromatologist, especially because of its coverage of the vitamins. The ceramist and packaging specialist will find worthy of their attention the standards for light-resistant containers and for chemical resistance of containers. The textile chemist will be interested in the standards laid down for surgical supplies. Those specialists who are engaged in teaching will find the treatise valuable for providing practica for their students. This fact suggests that teachers of inorganic, organic, and analytical chemistry can also benefit from the work by securing from it ideas for laboratory exercises, especially evaluations of the purity of ordinary preparations.

The section on general tests, processes, and apparatus (pp. 551-644) is quite notable, being rich in analytical information and of high value to every practicing chemist. It tells, to cite a few examples, how to ascertain the absorbency and fiber length of cotton, to examine for arsenic, to appraise gelatin bacteriologically, to find the purity of medicinal gases and the fineness of powders, to identify chemicals, to determine physical properties, and to assay drugs for potency. There follow a comprehensive section on reagents, test solutions, indicators, standard solutions, and hydrogen ions, and a series of useful tables. The whole is then elaborately indexed.

As brought out in detail earlier this year (THIS JOURNAL, 20, 13), to a greater extent than ever before pharmacopoeial recognition is given in this revision to organic synthetics in the province of medicine—a real tribute to organic chemistry, pharmacology, and chemotherapy. The following admissions to U. S. P. XII will be made by supplemental announcement (second supplement), probably appearing before the end of the year: sulfathiazole sodium, nonsterile, for ointments, and a special sterile grade for injections; sulfadiazine; sulfadiazine sodium, nonsterile and sterile; sulfaguanidine; calcium pantothenate; pyridoxine hydrochloride; and bioassay processes for the several vitamin B factors in medicinal preparations, likewise adaptable to foods.

"DREAMS DO COME TRUE"

A DREAM in a test tube becomes a preferred product tomorrow. Every worth-while invention or improvement on an existing process is the fruit of some thinker's dream. Constant thought and experimentation pay dividends.

Furfural

has made reality of many dreams. What better example is there than the oil refining industry, where Furfural is used as the selective solvent to remove the unsaturated and sludge-forming entities from tremendous quantities of high grade lubricating oil. Consider also the plastics industry, where Furfural is condensed with phenol or other materials to form resins of superior properties. As a preservative, dye solvent, and paint remover it does its job well.

Let us tell you how Furfural may help you. Typical properties of the regular grade are as follows:

Color	Straw yellow to amber
Boiling point	157–167° C. (99%)
Specific gravity (20/20)	1.161
Freezing point	—37° C.
Flash point (open cup)	56° C.
Refractive index (20/D)	1.5261

Check these
PHOTOSWITCH
advantages against
your
LEVEL CONTROL
problems

✓ NO FLOAT SWITCHES — Photoswitch Level Controls operate entirely by electronic relays . . . employ no float switches.

✓ UNLIMITED LIFE — Photoswitch Level Controls are built for timeless service . . . have no mechanical parts to wear out — no wartime replacement problems.

✓ LOW COST — Photoswitch Level Controls are simple and inexpensive to install . . . and over a period of time show the lowest average unit cost.

✓ SAFETY — Photoswitch Level Controls carry only microamperes of current and extremely low voltage . . . insuring safe operation even with combustibles.

PHOTOSWITCH Electronic Level Controls, effective for all conductive and nonconductive liquids and powders, are available for single-level indication or control, on and off pump control at two levels, and boiler feedwater control.

Probe fittings are attached to the tank at low and high level points, and wired to the PHOTOSWITCH control. When level falls below lower probe, electrical circuit controlling pump is closed, tank fills. When liquid contacts upper probe, fluid acts as conductor of small amount of current, opens circuit, stops pump. For pumping-out control, these operations reversed.

➡ *Write for Level Control Bulletin 1100.*

New Method of LIQUID CONCENTRATE CONTROL

PHOTOSWITCH Concentrate Control checks liquid mixtures right in your tank or vat.

- Indicates Electronically changes in Liquid Concentrations.
- Does away with the necessity of Laboratory "sample batch" testing.
- Can be used wherever the Liquids in mixture have any degree of conductivity.

CONTINUED FROM PAGE 1596

To the list of official reference standards for assay controls (pp. 607–8) will be added calcium pantothenate and pyridoxine hydrochloride for the same purpose.

The electrotyping, printing, and binding have been very well done. The paper and fabrikoid cover are substantial. Every purchaser will find that the volume will easily stand the heavy use to which it will be put.

W. A. HAMOR

Advances in Enzymology and Related Subjects. Volume II. Edited by *F. F. Nord* and *C. H. Werkman.* viii + 374 pages. Interscience Publishers, Inc., 215 Fourth Ave., New York, N. Y., 1942. Price, $5.50.

THIS is the second volume in a series of reviews invaluable to the enzyme chemist. As in the previous volume, specialized topics in the field of enzymology and related subjects are discussed by competent workers. For the most part these reviews have the advantage of being didactic and provide the reader with a fair background of the problem under consideration, a quality which increases considerably the audience to whom the volumes are useful.

The review by M. Delbrück deals with bacteriophages considered as viruses. Among the many topics covered very lucidly are: The "life cycle" in the host, the specificity of virus for host as compared to serological specificities, propagation of the virus in the absence of the host, etc.

D. D. Van Slyke discusses the selection of assay methods for hydrolytic enzymes on the basis of the kinetics involved.

"A Classification of Proteolytic Enzymes" by M. Bergmann supplements his previous article in Volume I. According to the author, proteinases may be classified on the basis of the ease with which they split peptide bonds of given types. Work with substrates of known structure is of course not original with Bergmann, but his is the first work sufficiently extensive to permit more than vague generalizations on differences in proteinase behavior. M. J. Johnson and J. Berger in the chapter on The Enzyme Properties of Peptidases employ the historical and more arbitrary system of classification of peptidases, which is illustrated by the terms, "dipeptidase", "polypeptidase", "leucyl peptidase", etc. Such a classification seems incongruous in the light of Bergmann's more fundamental system. Nevertheless, the article is the best résumé which the reviewers have seen of the accumulated data in the field of the so-called peptidases.

Diamine oxidase finally comes of age with a full review by E. A. Zeller, who has contributed more to its understanding than any other worker since Best reported "histaminase" in 1929. This article is in German. E. A. H. Roberts' summary of the chemical changes in the so-called fermentation of tea emphasizes the complex nature of the reactions involved. "Heterotrophic Assimilation of Carbon Dioxide" is the contribution of C. H. Werkman and H. G. Wood. Fixation of carbon dioxide by bacteria which normally require organic sources of carbon is now well recognized. This and the similar phenomenon in animal tissue are discussed with attention to the possible mechanisms involved. H. Tamiya presents in German an extensive review, which embodies much of his original work, on the respiration, fermentation, and associated enzyme systems of *Aspergillus.*

The brief but complete discussion, Cellulose Decomposition by Microorganisms, by A. G. Norman and W. H. Fuller serves to emphasize the paucity of knowledge concerning the actual changes in the cellulose and enzyme systems involved. E. J. Witzemann sets forth an hypothesis of the interrelationship of carbohydrate and fat catabolism.

In what the reviewers consider the best of a number of recent reviews on the subject, H. Dam covers the chemistry and physiology of vitamin K. In the final article, J. J. Pfiffner deals with the chemistry, isolation, methods of assay, and physiological effects of the adrenal cortical hormones and also touches upon the related adrenal steroids.

The book not only is valuable to the enzyme chemist, but, in spite of the title, it is of sufficient general interest to warrant a place in any biochemical library.

BERNARD AXELROD
MARIAN W. KIES

Annual Review of Biochemistry. Volume XI. Edited by *James Murray Luck* and *James H. C. Smith.* vi + 736 pages. Annual Reviews, Inc., Stanford University P. O., Calif., 1942. Price, $5.00.

IT IS already a great deal to say that the eleventh volume of this well-known review comes fully up to the usual standard. Certainly no biochemist could easily stay in business without access to a copy.

In spite of the war, about the usual number of papers have been considered, and there are 44 pages more of text than last year. The international character of the effort is shown in that eight of the 26 chapters came from sources outside the United States. One is tempted to speculate on the activities of A. G. van Veen

ANALYSIS

CHAS. PFIZER & CO., INC. has always regarded the careful and intelligent examination of all products as not only a necessary but also an important part of its manufacturing processes. We believe that the uniformity and high purity of our products cannot be assured without thorough examination and that it involves more than just the routine checking of materials against certain specifications.

The personnel of our Analytical Department is of the highest caliber and every effort has been made to make the most modern equipment available. Through thorough and careful analysis it has been possible for this department to make many suggestions which have resulted in improved products and improved methods of manufacture.

The research division of this department is constantly striving to improve or devise new techniques for the examination and analysis of our materials. New products, too, have always occasioned considerable analytical research, it often having been necessary to revise existing analytical methods to a great extent, or even to devise entirely new procedures. Needless to say, all of this would be impossible if analysis were considered to be merely a routine matter.

We feel that the reputation for dependability and high quality which our products enjoy is due in no small measure to our Analytical Department.

GREATER PRODUCTION *DEMANDS* GREATER CONTROL

Control in processing is going to become more difficult — as it becomes more necessary. Organizations are being disrupted at a time when greater demand for war material and substitutes for metal are adding an increased load to the process industries.

Investigate Prater equipment — for many phases of grinding and mixing it offers complete uniformity of results unfailingly delivered.

Every Prater Mill is sold on a basis of guaranteed output per horsepower hour and control of quality of grind and grain size.

May we analyze your problem?

shortly after he mailed his manuscript on Nutrition from Java.

Most of the usual subjects are covered. The customary section on sulfur compounds seems to have been replaced by one on phosphorus derivatives. Other less usual topics include: Lignin; The Chemistry of Visual Substances; Avian Biochemistry; Animal Pigments; Plant Tissue Cultures; Immunochemistry; and Microbiology.

Ben H. Nicolet

The Pirotechnia of Vannoccio Biringuccio (1540). Translated by *Cyril Stanley Smith* and *Martha Teach Gnudi*. 476 + xxvi pages. American Institute of Mining and Metallurgical Engineers, 29 West 39th St., New York, N. Y., 1942. Price, $5.00.

This volume has been translated under the sponsorship of the American Institute of Mining and Metallurgical Engineers (Seeley W. Mudd Memorial Fund). Pirotechnia is the earliest printed work in the field of metallurgy.

Gold, silver, copper, and iron have been found in archaeological excavations dated earlier than 3000 B. C. and the alloy bronzes date from about 2000 B. C. Nevertheless, there exists no document covering smelting and its related arts prior to Pirotechnia except a manuscript dated around 1100 written by the monk, Theophilus. In this connection it is interesting to note that De Re Metallica by Agricola (translated by the Hoovers) is dated 1556.

Pirotechnia covers a surprisingly wide field, since it describes not only the smelting and casting of metals and alloys but mining as well. In addition, the manufacture and use of explosives in the arts of peace and war are described in detail. The metals discussed are gold, silver, copper, lead, mercury, tin, iron, antimony, etc. Various minerals are likewise described ranging in character from salt and rock alum to emeralds.

The translation is exceptionally well

Service in Wartime

Now that the war—for America—is one year old. . . . Now that the Army is on the march and growing every day. . . . Now that Industry is backing up the Army man for man, it is time to take stock.

To the United States Government — and to its customers—the Michigan Alkali Company, manufacturers of Wyandotte Chemicals, is proud to make this report:

In 1942, all war orders have been met. They have been met fully, and before other orders.

In 1942, orders for all products — except chlorine — have been filled promptly and completely. (Chlorine has been available in increasing quantities on a priority basis.)

The filling of these orders is an example of *service* as usual, but *not* of *business* as usual.

In order to complete production schedules, Michigan Alkali plants have worked the clock around, seven days a week. And our orders have been met. Our customers have had service and supplies.

During 1943 we will keep the same goals in sight . . . to fill war orders first . . . and to meet our customers' needs as fully and as promptly as circumstances permit.

done, the English version being smooth and fluid. One can well visualize the difficulties encountered by Drs. Smith and Gnudi in converting sixteenth century Italian to mid-twentieth century English. They should be congratulated on their fine work.

So far as the processes described in Pirotechnia are concerned, Harvey S. Mudd, in his foreword, sums this up in one sentence: "Basically the old and the new are not very different." And in further confirmation of this, it is interesting to note that Biringuccio recommends a six-hour day.

All in all, this is a very worth-while publication and is recommended as a distinct addition to anyone's library.

MARX HIRSCH

Strength and Properties of Materials. *John Elberfeld.* 150 pages. Harper & Brothers, 49 East 33rd St., New York, N. Y., 1942. Price, $1.75.

THIS is a condensed treatment of the essential practical information that should be known by those engaged in industrial work. It is to the point and should be easily understood. It should be an excellent text for short courses, for trade schools, and for those preparing for unfamiliar work in war industries.

The book is about equally divided between engineering mechanics subjects (strength of riveted and welded joints, of beams, columns, shafting, etc.) and of the manufacture and properties of the more common engineering materials used in industry. Its appendix has about 20 pages of condensed tables adaptable to the problems most often encountered. It also contains tables of the trigonometric functions.

The instructor could easily supply whatever elaboration might be necessary if certain of the phases of the course should require slightly more detailed explanation or slightly larger scope.

This book is an excellent text for the field it covers. It should be in great demand for present and foreseeable near-term industrial conditions.

E. J. FETTIG

Mellor Química Inorgánica Moderna. *G. D. Parkes,* in collaboration with *J. W. Mellor.* Translated by *E. V. Zappi.* Rev. ed. 910 pages. Librería El Ateneo, Florida 340, Buenos Aires, Argentina, 1942. Price, $32 (Argentine).

THIS is a Spanish translation of the 1939 new and revised edition of Mellor's Modern Inorganic Chemistry, prepared by Enrique V. Zappi, professor in the Universities of Buenos Aires and La Plata, who has followed the original book faithfully.

A. S. T. M. Standards on Petroleum Products

ISSUED annually since 1927 and giving in their latest approved form all of the A. S. T. M. specifications, tests, and definitions pertaining to petroleum products and lubricants this publication sponsored by the A. S. T. M. Committee D-2 has come into widespread use.

The 1942 (October) edition includes some 87 standards, as well as several proposed tests not yet adopted by the committee.

Copies of this 450-page publication can be obtained in heavy paper cover from A. S. T. M. Headquarters, 260 South Broad St., Philadelphia, Penna., at $2.25 per copy.

ISOMERIZATION
OF
PURE HYDROCARBONS

by GUSTAV EGLOFF, GEORGE HULLA and V. I. KOMAREWSKY

Universal Oil Products Company, Research Laboratories and Illinois Institute of Technology

To all petroleum chemists, engineers and research workers in fields involving organic chemistry this long-awaited treatise will prove to be one of the most valuable scientific works published in 1942. It covers in the greatest detail the results of thousands of experiments in isomerization — the phenomenon responsible for the present high-octane motor fuels and other miracles of petroleum research. Nearly half the volume consists of exhaustive tabulations of reaction data which can be found nowhere else in chemical literature, and which will save untold hours of time on the part of those using them. The text is profusely illustrated with structural diagrams, and the entire book is characterized by the thoroughness and critical exactness of its authors.

S·A·R·G·E·N·T

SCIENTIFIC LABORATORY SUPPLIES

GREATER *Speed* AND *Accuracy* WITH

VYCOR

BRAND

LABORATORY WARE

Since its introduction in 1940, Vycor brand Ware, fabricated from 96% Silica Glass No. 790, has proved to be the most versatile of all laboratory ware.

Exceptional chemical stability, high softening point and extremely high resistance to heat shock are its outstanding qualities. Reactions can be carried on with greater *speed* and *accuracy*—a saving of valuable time! New fields are open to the scientist because of the upper temperature limit of this glass.

Vycor brand Ware has proved to be the perfect complement to the time-tried "Pyrex" Glassware which for over a quarter of a century has been so eminently satisfactory for day-in, day-out all-around laboratory service.

Vycor brand Laboratory Glassware is described in detail in Catalog LP21. Order from your regular laboratory supply dealer.

PROPERTIES OF VYCOR BRAND 96% SILICA GLASS NO. 790

Loss in weight, 100 lbs. steam pressure for 96 hours	0.0001 grams per sq. cm.
Loss in weight, boiling 6 hours in 5% $NaOH$	0.0015 grams per sq. cm.
Loss in weight, 5% HCl for 72 hours at 80° C.	Negligible
Softening Point, Approx.	1500° C.
Linear Coefficient of Expansion per ° C.	0.0000008
Specific Gravity 2.18	Refractive Index 1.458
Tensile Strength. Comparable to Chemical Glass No. 774	
Loss in Weight on Heating and Cooling	Negligible
Visible Light Transmission for 2 mm thickness	92%
Ultra Violet Transmission at 254 millimicron line for 2 mm thickness	2 to 4%
Temperature Limit in Service	900° C.

Anais da Associacao Quimica do Brasil

IN JANUARY 1942 the Chemical Society of Brasil began publication of a quarterly journal, *Anais da Associação Quimica do Brasil*, which is edited by C. E. Nabuco de Araujo, Jr., president of the society for 1941–42, for some years the Brazilian correspondent of CHEMICAL AND ENGINEERING NEWS and very active in South American chemistry. The journal is published in Rio de Janeiro and is written in Portuguese. The first two issues, which have reached us, are of about 80 pages each and contain interesting articles by Brazilian scientists on various phases of chemistry, based on research done in that country. The journal also gives the names of the officers of the society and of its regional and scientific divisions.

Syllabus in Chemistry

THE New York State Science Teachers Association has prepared a proposed revision of its Syllabus in Chemistry, which is intended as a preliminary step toward a more adequate direction of chemistry teaching in New York State. The chairman of the Chemistry Committee of the association is Carl Baisch, Head of the Science Department, Kenmore Senior High School, Kenmore, N. Y.

Totaquine from Cinchona Bark

FORMERLY quinine was extracted from cinchona bark and the rest was thrown away. Now, with the quinine supply in the hands of the Japanese, other medicinal substances in the bark will also be extracted and used for the same purposes as quinine. Totaquine is intended for use by the public, according to reports, to free additional supplies of quinine for fighting men in the malaria-infested countries, and is said to be the equal of quinine in its action.

Guayule Seed

WITH so much attention having been given to synthetic rubber, we have somewhat neglected guayule, but it is encouraging to know that the growth and harvesting of seed have gone on at such a rate that by the end of 1942 250,000 pounds of seed are to be available. Development of successful mechanical methods for harvesting the seeds from the 560 experimental acres planted in the Salinas Valley, California, has made this possible. It is estimated that one pound of seed will produce seedlings for two field acres. Two new nurseries are to be established in California to provide additional seedlings for harvesting in the fall of 1944.

How to get the best and LONGEST PERFORMANCE out of Barnstead Water Stills

Drain residual water from the evaporator of your Barnstead Still every day, to remove concentration of impurities. If your still is electric or gas operated, make sure that there is always enough water flowing into the still to prevent any burning out of the heating elements. And always keep the interior of your still clean.

If you do these three simple things, your Barnstead Water Stills should produce a consistent high grade of distilled water for years and years without trouble.

Closing dates advanced

Publication and closing dates of Chemical and Engineering News

Issue of the 10th closes—20th of preceding month; mails 7th of month.

Issue of the 25th closes—5th of the month; mails 22nd of month.

We urgently ask that advertisers make it a point of having complete copy in our hands *before* the closing dates shown to enable prompt publication and mailing.

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

Acrawax C. A circular describes means of overcoming blocking and stickiness in coatings containing synthetic resins. *Circular CEN.* GLYCO PRODUCTS Co., 228 King St., Brooklyn, N. Y.

Centrifugal Compressors. A 20-page catalog describes and illustrates Design 9 centrifugal compressors, designed for application wherever blowers of smaller capacity work are required. It contains descriptive data, performance tables, dimension diagrams, unit and installation photographs. *Catalog 386-2 CEN.* B. F. STURTEVANT Co., INC., Hyde Park, Boston, Mass.

Chain Drives. First aid for chain drives, things to be done to keep chain drives running, are included in a 6-page folder. *Folder 1951 CEN.* LINK-BELT Co., 307 North Michigan Ave., Chicago, Ill.

Ignitron-Mercury Arc Rectifiers in the Steel Industry. A 28-page bulletin, profusely illustrated, outlines conversion equipment problems in the steel industry and discusses applications of ignitron-mercury arc rectifiers in meeting these problems. *Bulletin GEA-3827 CEN.* GENERAL ELECTRIC Co., Schenectady, N. Y.

Mixers. Straightline mixers for flocculation tanks at sewage and water-treatment plants are covered by a new 4-page illustrated folder. *Folder 2042 CEN.* LINK-BELT Co., 307 North Michigan Ave., Chicago, Ill.

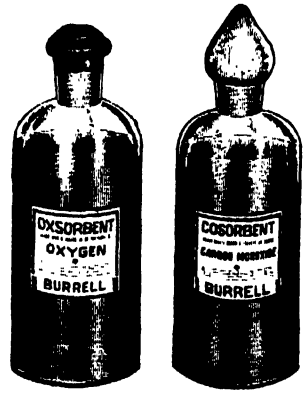
Power Transformers for Mercury-Arc Rectifiers. A new 4-page bulletin describes and illustrates the interior and exterior construction details of two G-E mercury-arc rectifier transformers which are typical of sizes both above and below 1000 kw. *Bulletin GEA-3883 CEN.* GENERAL ELECTRIC Co., Schenectady N. Y.

Pressure and Temperature Controls. An 8-page booklet describes controls and shows suggested methods of application. *Bulletin 836 CEN.* ALLEN-BRADLEY Co., 1311 South First St., Milwaukee, Wis.

Propeller Fans. A brochure on self-cooled motor-propeller fans, universal blowers, and unit heaters. In 42 duotone photographs a comprehensive bird's-eye view of two wars is given. Blackout ventilation systems, portable fume exhausters, cooling communication apparatus, heating, etc., are all touched upon. *Brochure 305 CEN.* ILG ELECTRIC VENTILATING Co., 2850 North Crawford Ave., Chicago, Ill.

Resin Glues. The fourth edition of a 20-page handbook describes resin glues for all kinds of veneer bonding. *Handbook CEN.* PERKINS GLUE Co., Lansdale, Penna.

Steam Generator. A simple, efficient steam generator which needs only fuel and water for automatic operation is described in this booklet. This flash-type generator works on the principle of jet control, without the use of thermostats or motor-driven pumps, and furnishes feed water in direct proportion to the amount drawn off as steam. Burners are provided for gas or oil fuel; no pit is required; no firebox or electrical connections are needed. Units from 10 to 70 horsepower are available, the small unit developing 150 pounds steam in less than 5 minutes from a cold start. *Booklet 222A CEN.* SUPER MOLD CORP. OF CALIFORNIA, Lodi, Calif.



"Unique" Process Equipment. This bulletin is a convenient, file-size reference piece which illustrates and briefly describes the latest developments in, and additions to, the "Unique" line of mixers, sifters, cutters, crushers, grinders, attrition mills, hammer mills, pulverizers, and rubber-reclaiming equipment. It is useful for every phase of the processing industries. *Bulletin 300 CEN.* ROBINSON MFG. Co., 30 Church St., New York, N. Y.

Vinylite Plastics. A 12-page booklet describes vinylite plastics for wire and cable insulation and reviews the advantages of their use from the standpoints of installation, service, and safety. *Booklet CEN.* HALOWAX PRODUCTS DIVISION, UNION CARBIDE AND CARBON CORP., 30 East 42nd St., New York, N. Y.

Water Spray Nozzle. This leaflet describes an "Alfcospray" spray nozzle developed to meet the demand for an all-spray unit. From the shut-off position, a slight turn gives a cone spray of 40°. Further rotation of the head gives cones up to a full curtain of 150°. This permits the covering of a large area with abundant water and, because no solid stream of water is present, there is no means of live current making contact. *Leaflet CEN.* AMERICAN-LAFRANCE-FOAMITE Co., Elmira, N. Y.

New and Better —

GAS ANALYSIS SOLUTIONS

A39-710 A39-720

***OXSORBENT*—For determination of oxygen in gas analysis**

1 — Removes oxygen in two passes
2 — Breaks sharply at the saturation point
3 — Absorbs all of the oxygen
4 — Forms a stable compound with oxygen
5 — Rises cleanly in the capillary
6 — Absorbs four times its volume of oxygen
7 — Slightly acid — prevents sticking stopcocks
8 — Accurate and fast to exhaustion
9 — Either Oxsorbent or Cosorbent costs $3.50 per 8 oz. bottle

***COSORBENT*—For determination of carbon monoxide in gas analysis**

1 — Absorbs carbon monoxide cleanly to the last trace
2 — Forms a stable compound with carbon monoxide
3 — Has no vapor tension. — Absorbs oxygen slowly
4 — Acid — does not cause stopcocks to stick
5 — Absorbs ethylene and acetylene and may be used for determining these gases
6 — Will not absorb hydrogen, nitrogen, or methane and other saturated hydrocarbons

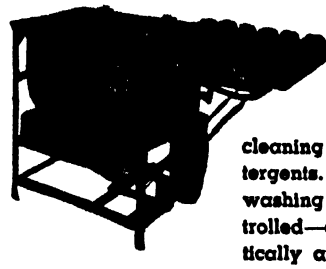
Years of use condensed to a few days with

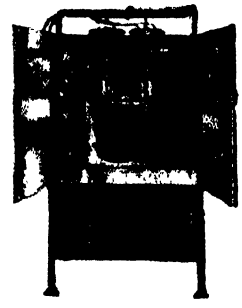
ATLAS-OMETERS

ACCELERATED TESTING EQUIPMENT



ATLAS-OMETERS offer a simple, controllable method of reducing months of actual use conditions to just a few days testing. By accelerating the effect of sun, weather, and laundering, they determine, in your laboratory, how a product will resist sun, washing and weathering. Government requirements for many products specify the use of the Fade-Ometer, Launder-Ometer, or Weather-Ometer.

ATLAS FADE-OMETER

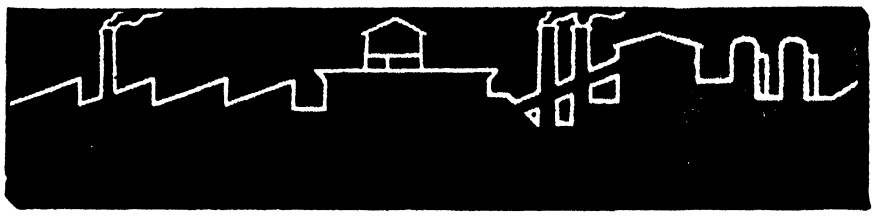


The accepted standard for determining the fastness to light of dyes and fabrics—originated and made solely by Atlas, and now used all over the world. Atlas enclosed Violet Carbon Arc represents closest approach to natural sunlight. Temperature automatically controlled.

ATLAS LAUNDER-OMETER

Standard laboratory washing machine of the A.A.T.C.C. Tests washing action, textile shrinking, staining, and color fastness to dry cleaning solvents, soaps and detergents. All factors, including washing action, carefully controlled—can be reproduced identically at any time.

ATLAS WEATHER-OMETER



Reproduces faithfully the destructive action of sun, rain, heat and cold, with all the attendant phenomena of expansion and contraction. Shows natural weathering effect from any given conditions at any time, any location. Newest Weather-Ometer has twin arcs, for faster testing.

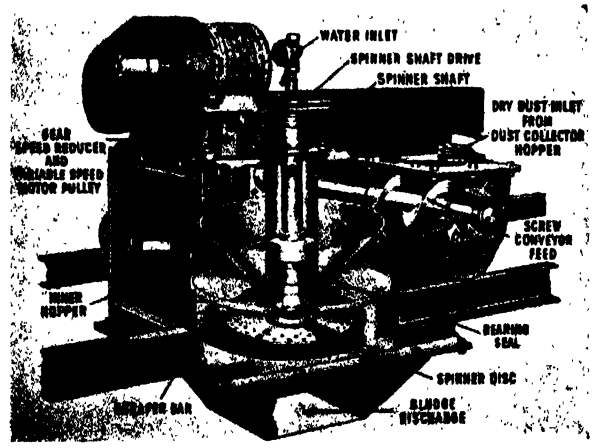
Agitated Wood Tanks



THE H. K. Porter Co., Inc., 4945 Harrison St., Pittsburgh, Penna., has added to its process equipment line agitated wood tanks made from cypress, redwood, long leaf yellow pine, fir, oak, and poplar and equipped with Porter Better Built agitators.

Wood tanks for the storage of water, oil, chemicals, and various solutions for pickle processing, vinegar generating, and many other purposes may be obtained in all shapes and sizes, up to 100,000 gallons capacity.

Screw Conveyor Feed

A SCREW conveyor feed has been added to the American wet disposal unit to provide a constant and uniform rate of feed of discharged dust from dry-type dust collectors into the sludge forming device.

The American wet disposal unit, introduced in 1941 by the American Foundry Equipment Co., 555 South Byrkit St., Mishawaka, Ind., is designed to make a wet sludge of the dust discharged from the hoppers of dry-type dust collectors by centrifugally mixing the accumulated dust with water or other liquids.

Plastic Replacement for Steel

PLASTIC compositions which can replace steel or other metals in many uses may now be manufactured by incorporating with various cellulosic fibers a resin powder known as Vinsol, extracted by Hercules Powder Co. chemists from the southern pine tree.

This new structural resin plastic is a thermoplastic, fibrous-resin composition, hard, dense, stiff, but with reasonable toughness. It is described as sturdy but lightweight and has low water absorption.

Fibers used in the production process include newsprint, clean cotton rags, sulfite, sulfate, and the like, in straight or

Specify EIMER AND AMEND
TESTED PURITY REAGENTS

Informative Labels

Eimer and Amend was the first reagent chemical manufacturer in America to state the exact amount of impurities on the label —not merely the maximum amount of impurities. That practice has not been changed.

Chemists who employ E & A Tested Purity Reagents can depend upon their purity and the exact analysis on each label.

ARMSTRONG Low Cost, Efficient Steam Type HUMIDIFIERS . . .

ATTENTION WOOD WORKING DEPARTMENTS

Approximately 1% dimensional change in wood results from every 3% change in moisture content making humidification essential to precision woodworking. Write for full details on the application of Armstrong Humidifiers in this vital, fast-growing industry.

WHEN you install Armstrong Unit Humidifiers you don't have to disrupt plant routine to make complicated hook-ups. Just connect them into existing steam lines with a minimum amount of critical materials.

Armstrong Humidifiers are low in initial cost and operating expense, too. Units capable of handling 40,000 cu. ft. of space or more list at only $100.00 complete, with sensitive Friez humidistat and all accessories. The steam they use is available in most plants for less than $1.00 per ton. *Ask for literature!*

mixed furnish. The Vinsol resin is currently available without priorities.

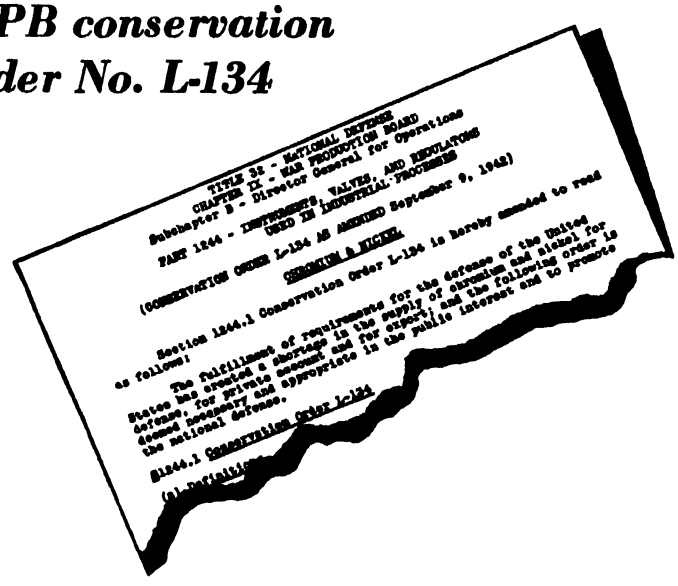
Lucite in Water Purification

THE transparent chemical chamber of a water purification unit on an emergency "blitz buggy", marketed by Proportioneers, Inc., Providence, R. I., is a recent wartime application of Lucite methyl methacrylate resin.

Long-range enemy bombers are a constant threat to civilian water works. This mobile "blitz buggy" carries equipment for emergency pumping, decontamination, and purification of water for drinking and fire-fighting.

The large chamber of Lucite on the chemical feeder allows the operator to keep a constant check on the chlorine or other chemical being used to purify water.

Induction Heating Speeds Tin Plate Output



HARNESSED to save dwindling supplies of tin, high frequency induction heating is now producing a smooth, shiny, corrosion-resisting finish on tin plate urgently needed to protect rations for the Nation's armed forces.

Already at work in a big steel mill the first commercial installation is now producing about 60 tons a day of 14-inch strip. The new method was developed by Westinghouse research and radio engineers to boost output to keep pace with rapidly growing requirements of the armed forces and at the same time use a minimum of tin. It was designed as the final step in making electrolytic tin plate, a process which uses only one third as much tin as the system of dipping steel sheets into tanks of this molten metal. The need for a suitable tin fusing was so urgent that research work which would normally require two years was completed in less than six months.

Present electrolytic lines operate at a speed of 500 feet per minute, but in the

in compliance with WPB conservation order No. L-134

TITLE 32 - NATIONAL DEFENSE
CHAPTER IX - WAR PRODUCTION BOARD
Subchapter B - Director General for Operations
PART 1244 - INSTRUMENTS, VALVES, AND REGULATORS USED IN INDUSTRIAL PROCESSES
(CONSERVATION ORDER L-134 AS AMENDED September 9, 1942)
CHROMIUM & NICKEL
Section 1244.1 Conservation Order L-134 is hereby amended to read as follows:
The fulfillment of requirements for the defense of the United States has created a shortage in the supply of chromium and nickel for defense, for private account and for export; and the following order is deemed necessary and appropriate in the public interest and to promote the national defense.
§1244.1 Conservation Order L-134

Many valuable solutions to problems arising from the new WPB Conservation Order L-134, which drastically limits the use of various materials for thermocouples, lead wire, thermometer bulbs, protecting tubes, etc., are given in the recently published Wheelco Supplement to Thermocouple Bulletin S2-3. The Supplement S2-3 is the result of an extensive analysis of the WPB Order L-134 by Wheelco Engineers and is published for the benefit of those who will be affected by this order. The Supplement also contains a partial summary of the L-134 Order; the complete L-134 Order as amended September 9, 1942, additions and revisions applying to various items in the Wheelco S2-3 Bulletin and a complete list of Wheelco Sales and Service Engineers who can help you with your instrument problems.

Write for your FREE copy of Supplement to Bulletin S2-3 and the issue of Wheelco Comments which deals with Thermocouple construction and maintenance. Also request copy of Bulletin S2-3 if you do not have a copy.

STEBBINS

Properly Engineered & Installed

LININGS

FOR a long time to come processing apparatus must operate efficiently at peak capacity. To do so, the equipment must incorporate materials, engineering skill and workmanship of the highest order.

Chemical engineers have recognized these essential characteristics in Stebbins Linings for successfully handling acid, alkali and corrosive liquids, gases and vapors in a wide range of equipment.

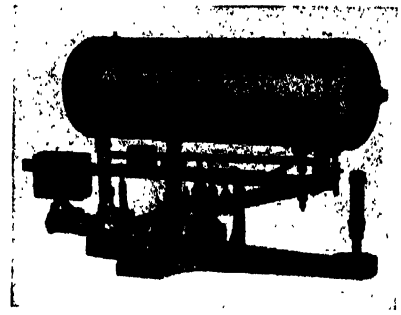
By employing Stebbins Service, plant owners are assured of a design according to latest engineering practice, materials specifically adapted to operating conditions and superior construction. Under a lump sum contract, Stebbins Service provides all materials and labor with an unqualified guarantee of complete satisfaction.

SEMCO

Stebbins Engineering and Manufacturing Company

367 EASTERN BLVD. WATERTOWN, N. Y.

near future it is expected they will go up to 1,000 feet per minute. This new induction heating method of finishing the tin plate could easily match that speed, whereas gas furnaces operate at only 150 feet per minute and the hot oil treatment is extremely slow—about 50 feet a minute.



Palladium for Jewelry

COMMENTING on the recent order of the War Production Board restricting the use of platinum in jewelry, Charles Engelhard of Baker and Co., Inc., Newark N. J., concurred in the recommendation concerning the use of gold and palladium intead of platinum. The jewelry trade has available without restriction ample supplies of gold and palladium.

Palladium alloys have the required strength and hardness for rings and for the setting of gems with security, and they can be readily worked in pins and other larger pieces.

Palladium is lighter in weight than platinum, is about as heavy as 14 karat yellow gold and has a current market value approximating 70 per cent that of platinum.

Tilt Trap

A NEW three-valve tilt trap for variable pressures on lifting service has been added to the line of deaerating systems for steam drainage and boiler feeding made by the W. M. Acker Organization, Inc., Cleveland, Ohio. The sturdy construction of female trunnion supported on center bearings, and male steam and water ends which are relieved of any weight carried on the packing, is the same as that used on the basic Acker return and non-return tilt traps.

Cellulose Nitrate in War

OLDEST of all the plastics and a veteran of World War I, cellulose nitrate is back in uniform in this war, the Plastics Department of E. I. du Pont de Nemours & Co. reports.

Made first by Hyatt in 1869 as a new hard material for billiard balls, cellulose nitrate plastic today is one of three essentials of modern war manufactured from the same base—nitrocellulose. By varying the degree of nitration and the ingredients subsequently added, chemists derive smokeless powder, plastics, or lacquers.

Smokeless powder is a military propellant. Cellulose nitrate plastics are used for transparent enclosures of trainer planes, auxiliary primers for munitions, and a host of things military. Nitrocellulose lacquers protect ammunition, planes and tanks against sea water, sun, and weather.

Xylidine, drums	lb.	.35
Zinc ammonium chloride, bbls.	lb.	.0565
Chloride, tech., fused, drums.	lb.	.05
Dust, bbls., c/l.	lb.	.1035
Metal slabs, at N. Y.	lb.	.0866
Oxide, Amer., bags	lb.	.0725
Stearate, tech., bbls.	lb.	.30
Sulfate, cryst., bgs., c/l., wks.	100 lbs.	3.60

* Nominal.

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum ge $2.00 each; include 8 words for box address. Exceptions see ⟶ lay, $10.00 per column inch. 2 inches maximum, larger units at regular y unit rates. No discounts or allowances.

advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 5th and 20th, closing dates for editions of CHEMICAL and ENGINEERING NEWS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete. EMPLOYERS are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

UNEMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 announcements free (one per issue) set in standard style and limited to 50 words each, including 8-word box address, and 3 additional standard announcements at 50% of regular rate. Further announcements and excess words at full rate.

EMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

EMPLOYERS seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contracts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemist's Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 505 N. Michigan Avenue, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

EXECUTIVES, CHEMICAL ENGINEERS AND CHEMISTS with exceptional backgrounds of experience should use our confidential and individual method of contacting responsible employers. No limit to territory. We negotiate all overtures. Established 1915. The National Business Bourse, 20 W. Jackson Blvd., Chicago, Ill.

CHEMIST WITH some petroleum experience. Needed in Chicago area for development of petroleum products and rust preventives. State age, draft status, degree, and salary desired in opening letter.
Box 18-NP-11, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST WANTED—Instructorship or Assistant Professorship in Southern Medical School for the duration. Give details concerning training, experience, personal history, references, and date of availability.
Box 42-N-11, Ind. & Eng. Chem., Easton, Pa.

LACQUER CHEMIST with several years' experience in lacquer formulation or application for development work on protective coatings applied to metals. Eastern Pennsylvania location. In reply, state salary desired, draft status, etc.
Box 32-TP-11, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST as library assistant and for abstracting, carding, filing and necessary typing in Western New York research laboratory. Translating German and French desirable. Describe training, experience and salary desired. Submit photograph.
Box 10-N-12, Ind. & Eng. Chem., Easton, Pa.

WANTED: Instrument Expert by leading aircraft engine manufacturer in East. Engineering training and calibration experience required, not necessarily in aircraft engines. Must be able devise new and note nearly accurate methods of temperature and pressure measurement and improve existing methods. No application sought from persons employed in war production.
Box 11-N-12, Ind. & Eng. Chem., Easton, Pa.

WANTED: Research Chemist, girl for laboratory in Rhode Island. Inorganic work closely related to the war effort. Apply giving full details.
Box 13-NP-12, Ind. & Eng. Chem., Easton, Pa.

WOMAN BIOCHEMIST with B.S. or M.S. degree wanted for research assistantship in New England college. Position available January first. Salary $1000 for ten months. Some knowledge of physiology desirable. Send complete information including transcript of record, names of references, small photograph.
Box 19-N-12, Ind. & Eng. Chem., Easton, Pa.

RESEARCH ASSISTANT, preferably college graduate familiar with chemical operations, to assist in physico-chemical investigations in laboratory located in Washington, D. C. Salary and advancement commensurate with ability. Give full particulars; education, experience, race, religion, age and draft status. Enclose recent photograph. An especially good opportunity for a man of some technical ability who is not subject to draft.
Box 21-N-12, Ind. & Eng. Chem., Easton, Pa.

SALES ENGINEER FOR CHEMICAL EQUIPMENT

We have an unusual opening in our New York Office for a young sales engineer with a sound technical background—with or without previous experience in selling chemical and process equipment. He must have imagination and possess a good sales personality. Our organization is one of the oldest and best known in the industry and is "going places."

Tell us all about yourself: your age, previous experience if any, etc. We'll make the salary attractive.

Box 22-NP-12, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER to take charge of established plant manufacturing organic chemicals near New York City. Permanent position with attractive future. Must have 10-15 years' experience in plant management and chemical operations. Must have knowledge of operations of chemical equipment. Must have ability to handle men. Write, giving detailed history of experience. Reply will be kept in confidence.
Box 23-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, man (with deferment) or woman with basic training in analytical and organic chemistry for laboratory work. Research opportunity probable. War industry, Metropolitan area. Give details of education and experience, salary desired.
Box 27-N-12, Ind. & Eng. Chem., Easton, Pa.

METALLURGIST—acquainted with metallography, industrial radiography, alloy preparation and treatment, and physical testing. Excellent opportunity in light metals field. Give full details in first letter, including minimum salary and photograph. Location Southwest.
Box 31-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER or Chemist. Recent graduate with some experience, as assistant in research and development along chemical engineering and metallurgical lines. Should be capable analyst and handy with tools. Location in East. Give full details, scholastic record, experience, salary desired and recent photograph.
Box 32-N-12, Ind. & Eng. Chem., Easton, Pa.

COMPETENT ORGANIC Chemist, preferably Ph.D., 30 to 35 years old with family. Must have good personality, ability to sell ideas and get along with people, talent for, although not necessarily experience in, administrative chemical research. Salary open.
Box 34-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER with experience in chemical plant design, mechanical engineering and product design, to work for plant in East. Must be draft exempt and not employed at your highest skill in any other war plant.
Box 35-N-12, Ind. & Eng. Chem., Easton, Pa.

MECHANICAL ENGINEERS AND DRAFTSMEN

Write or Apply in Person to
The Aluminum Company of America
Plancor Plant
P.O. Box 210 Massena, New York

TUTOR: To teach undergraduate inorganic chemistry starting February 1, 1943, in a college located in New York City. Must be a U. S. citizen and preferably have advanced degrees. If male, please include draft status in replying.
Box 50-N-12, Ind. & Eng. Chem., Easton, Pa.

BACHELOR, recent graduate with good organic training for synthetic work in new organic research laboratory in essential industry. Chicago area (interviews in New York City possible). Submit complete details on education, experience, personal data, salary expected, recent photo.
Box 51-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER: Excellent opportunity for man qualified to do research and development work on Iron Plating and Iron Forming. Large manufacturing company located in Middle West. Please submit record of training and experience, personal history and a recent small photo.
Box 52-N-12, Ind. & Eng. Chem., Easton, Pa.

INSTRUCTORSHIP in Chemical Engineering in midwestern college. Qualified instructor desired to teach Stoichiometry and Laboratory courses in Chemical Engineering. $1800 for 9 months' year. Opportunity for research.
Box 54-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL ENGINEER—not older than 30 years. Experience in paint formulation advantageous but not essential. Excellent future for qualified man. Submit complete personal, scholastic, and professional data. State draft status and salary expected. All replies confidential. Location Middle West.
Box 55-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST with thorough basic knowledge of alkyd resin and associated products manufacturing. Production experience wanted but not required. This opportunity is not a defense job primarily, and may be considered as permanent to the right man. Location northwest side of Chicago.
Box 56-N-12, Ind. & Eng. Chem., Easton, Pa.

We wish to contact an individual organic chemist who is desirous of getting in on the ground floor of a potentially very profitable business. We have almost completely solved the engineering and chemical difficulties involved in the production of the Cacodylates which are considered as vital Health Supplies, but now need financial assistance and a competent organic chemist to help us complete the project and turn this into a very profitable business.
Box 61-NP-12, Ind. & Eng. Chem., Easton, Pa.

FOOD TECHNOLOGIST: Applications will be welcomed from men with outstanding records to serve as junior chemists in eastern research laboratories, engaged in essential work. Prospects for advancement excellent for men of right qualifications. Please submit record of training and experience, personal history and recent photo.
Box 64-NP-12, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 1614)

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised, or in regard to those seeking employment.

Experienced Chemical Engineer

Excellent opportunity for man of outstanding qualifications in research laboratories located in the East; occupied with essential activities. Please submit college record, experience, accomplishments, and small photo.

Box 65-NP-12, Ind. & Eng. Chem., Easton, Pa.

WANTED: Recent college graduate with B.A. degree wanted by eastern woman's college as part-time assistant in General Chemistry or Qualitative Analysis. Work to begin February 1st; opportunity for graduate study.
Box 67-NP-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST with some petroleum experience. Needed in Chicago area for development of petroleum products and rust preventatives. State age, draft status, degree, and salary desired.
Box 70-NP-12, Ind. & Eng. Chem., Easton, Pa.

LABORATORY HELPER for research in university in New York City. Must have had practical experience in handling chemical apparatus and preparing compounds. Typing ability desirable. Submit data, including experience and references from persons familiar with your technical ability.
Box 72-NP-12, Ind. & Eng. Chem., Easton, Pa.

RESEARCH project in university in New York area needs laboratory technician to assist in synthetic organic work and in other biochemical research. Male or female. Salary commensurate with qualifications. Please give personal data, experience, and references to persons familiar with technical training.
Box 73-NP 12, Ind. & Eng. Chem., Easton, Pa.

PAPER CHEMISTS: Experienced in synthetic resin glues and adhesives. Must be thoroughly grounded in development work and familiar commercial application in paper field. This is an excellent opportunity to take over a responsible assignment in field work for one of the country's leading chemical companies. Write outlining your educational background and experience.
Box 76-NP-12, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST: Research Department heavy chemicals plant Detroit area doing considerable war work. Permanent position for man or woman. Industrial experience preferred. Adaptability varied work, inorganic, organic, development new methods required. Enclose photograph. Salary commensurate with qualifications.
Box 78-N-12, Ind. & Eng. Chem., Easton, Pa.

TEACHING FELLOWSHIPS for Women, half-time assisting, half-time Graduate study; Master's degree in two years. $600 first year, $700 second year, free tuition, fees. Start September 1943. Send transcript, recommendations and photograph by January 15 to
Gilbert H. Ayres, Chairman, Chemistry Department, Smith College, Northampton, Mass.

ASSISTANT PROFESSOR of Chemical Engineering desired by technical institute in Metropolitan Area. Full-time; teaching Thermodynamics and Chemical Engineering. Applicant should be Protestant and active member of A.I.Ch.E. Send information, together with photograph.
Box 84-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMISTS

with Bachelor or Master degrees for positions in laboratories of Analytical Chemistry, Bio-chemistry, Organic Chemistry and Physical Chemistry in eastern organization engaged in essential activities. Opportunities for qualified men. Submit details concerning training, experience, personal history, and small photo.

Box 66-NP-12, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, M.S. or Ph.D., with training and experience in cellulose chemistry. Also, Pulp and Paper Chemist or Chemical Engineer with machine knowledge. Give age, training, experience, references, draft status, photograph, salary desired and other essential data. By essential war, southern manufacturer.
Box 90-NP-12, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(A.C.S. MEMBERS)

CHEMICAL ENGINEER, B.S. (Ch.E.) 3½ years' experience in photographic chemicals, photography, and salesmanship. 22 years old, single, draft status 2-A. Not particular what field of Chemical Engineering work is in. Available after Dec. 1, 1942.
Box 59-N-11, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST—13 years' experience as supervisor in analytical laboratory of large rayon plant. Employed at present. Married, one child, age 39, draft 3-A. Desire permanent position with greater chance for advancement than present position.
Box 60-N-11, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 1941, now employed but desires advantageous change. Experienced in basic organic, especially pharmaceutical, dyestuffs, and photographic chemistry. Industrial or academic position considered.
Box 25-T-11, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.A., 2 years' experience in commercial analytical control work. Desire to enter organic field. Single, age 37, draft 4-F. Prefer to be located in Mountain or Pacific time belts.
Box 31-T-11, Ind. & Eng. Chem., Easton, Pa.

VAPOR PHASE catalytic chemist and chemical engineer with ten years' experience, mostly in research and development work with a little plant control. Also some general organic and inorganic experience. Location immaterial. Available immediately.
Box 36-T-11, Ind. & Eng. Chem., Easton, Pa.

TRANSLATIONS, TYPING. Woman Chemist: Many years' experience in Industrial chemistry, a well qualified Russian translator and an expert typist, desires translations and/or typing which can be done at home.
Box 37-T-11, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D. Desires research or teaching position. Author over fifty papers, chiefly enzymes, vitamins, clinical chemistry. Holder fellowships including Rockefeller. Immediately available. Age 34, American, married, draft 3-B. Good references.
Box 46-T-11, Ind. & Eng. Chem., Easton, Pa.

RUBBER AND PLASTICS Chemist, M.S. Fifteen years' research and development experience in rubber and associated industries. Experienced in field contacts, laboratory management. Physics and mathematics training. Age 42, with family. Place of responsibility desired.
Box 52-T-11, Ind. & Eng. Chem., Easton, Pa.

PLANT SUPERINTENDENT: Chemical Engineer, five years' experience all phases of alcoholic fermentation and distillation; whiskey and alcohol; plant operation and laboratory control. Seeks position as superintendent of production in fermentation industry. Available reasonable notice. Native American, married, age 31, draft 3-A.
Box 53-T-11, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D. Eight years' wide research experience with large concern; food products, vitamin synthesis and assays, industrial fermentations. Publications, patents. Now employed, desires position progressive organization undertaking expansion of research or setting up new department. Age 34, married. Available, reasonable notice.
Box 73-T-11, Ind. & Eng. Chem., Easton, Pa.

SURFACE CHEMIST—Ph.D. Just graduated from midwestern university. Well grounded in analytical, organic, and physical chemistry. Was graduate assistant. Two years' assistant chemist. Christian, draft 2-A, available immediately. Desires midwestern or eastern location and war work.
Box 12-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, Ph.D. desires responsible research position preferably in industrial chemicals, pharmaceuticals or foods. Qualified by training and experience to take charge of an extensive research program. Licensed chemical engineer. Age, past 45. Salary, $7500 minimum. Only permanent position considered.
Box 14-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.S. Three years' industrial experience analytical research. Desires change to chemical engineering development work, research, or process development in defense or essential civilian industry. Married, Protestant, 27, draft 3-A.
Box 16-N-12, Ind. & Eng. Chem., Easton, Pa.

REGISTERED CHEMICAL Engineer experience as director of research available for permanent position of responsibility with established firm or institution. Successful record 21 years' research and development. Patents. Member A.I.Ch.E. Graduate eastern university. Specialist plastics, resins, waxes, asphalts and other insulations and water-proofings. Age 44, married, children, Presbyterian.
Box 20-N-12, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST wants real job. Ph.D., 1933. Seven years' industrial organic research (synthesis), development, supervision, technical service in antiseptic, insecticide fields. Patents pending, two years' teaching experience. American, 36, married, children, Protestant, 3-A. Employed New York area, not connected with war effort.
Box 24-N-12, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL, ANALYTICAL Chemist, Ph.D., 1935, large mid-western university. Well trained in inorganic, organic, and physics. Excellent scholastic record; honor societies. Publications. Fifteen years' teaching experience; two and one-half years' experience research chemist with large corporation. Now Associate Professor, teaching physical, thermodynamics, electrochemistry, advanced analytical, in state supported school of technology. Desires responsible position in essential industry. American, age 38, married, one child, 3-A. Available February 1.
Box 25-N-12, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D., Minnesota, 1941. Experience in college teaching and industrial research. Desire research or teaching position. Member Sigma Xi, Phi Lambda Upsilon. Age 29. Excellent health, married, now employed, Presbyterian, practical, good character, personality.
Box 29-N-12, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, M.A., leading university. Thorough training in analytical, organic, and physical chemistry. Excellent background in mathematics and physics. Handy with tools. Now on West Coast but available anywhere immediately. Desire position in defense work.
Box 33-N-12, Ind. & Eng. Chem., Easton, Pa.

PAINT CHEMIST: B.S. Chemical Engineering. Thirteen years' varied experience in direction research, production and sales service of paints, varnishes, synthetic resins. Specification experience. Age 36, married, three children, draft 3-A. New York area preferred.
Box 36-N-12, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, special experience in styrene chemistry, also research in Bakelites, and considerable analytical experience. Thoroughly experienced in literature and patent searches, and very good foundation in languages. Age 39, one dependent. Desires position in industry contributing to war effort. Presently employed.
Box 37-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST AND BACTERIOLOGIST, Ph.D., director consulting laboratories. Experienced in research and development of new products and processes, practical accomplishments, patents. Executive ability, several languages, excellent record and credentials. Interested in permanent position.
Box 38-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL EXECUTIVE, Ph.D., capable, industrious, thoroughly trustworthy, several languages. Desires position as assistant of administrative officer, technical representative of reputable concern or other situation requiring initiative and offering good opportunities. Excellent references.
Box 39-N-12, Ind. & Eng. Chem., Easton, Pa.

INSTRUCTOR IN BIOCHEMISTRY in large university medical school desires change. Author of numerous papers. Age 31, draft deferred. Experienced in research direction and teaching. Member of American Society of Biological Chemists. Will consider industrial research or teaching position. Ohio preferred.
Box 41-N-12, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST: Ph.D., January 1943. Broad training in Physical and Industrial Chemistry. Minor bacteriology. Three years' experience in organic manufacture and research. Phi Lambda Upsilon, Sigma Xi, publications. Desires research and development. Age 26, married, locate anywhere, draft 3-A.
Box 42-N-12, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., 26, proven versatility and initiative. Synthesis sulfonamides, vitamin E, arsonic aids, explosives (nitro compounds, nitrates, nitramines). Wide experience enzymes, especially oxidases. Good background physical chemistry, research surface chemistry, publications, honor societies. Single, Draft deferred, available immediately.
Box 44-N-12, Ind. & Eng. Chem., Easton, Pa.

LIAISON EXECUTIVE for research and patent departments, Ph.D. and LL.B., fifteen years' diversified experience in industrial chemistry and technical-legal problems including synthetic resins, dyes, petroleum, rubber and patents.
Box 45-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST: Ph.D., 1936, University of Illinois, Organic and Physiological. Six years' industrial experience including laboratory, field, and pilot-plant work. Especially familiar with soluble polymers, protein insolubilization and leather technology. Age 32, married, two children. Employed in non-war work, draft 3-A. Desires change permitting greater contribution to war effort and requiring less traveling. Location inconsequential; preference, middle west or west.
Box 46-N-12, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHING desired, preferably starting next academic year. Ph.D. organic, 1938. Three years' college teaching. Two years' post-doctorate bio-organic research. Publications, Christian, draft 3-A, age 29.
Box 47-N-12, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, Ph.D., desires position with future. Prefers careful, scientific experimentation and can resolve problems into significant components. Fifteen years' industrial experience studying production of new inorganic compound, solubility diagrams and paper pulp bleaching. Publications and patents. Now employed. Age 43, married, three children, draft 3-A.
Box 48-N-12, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, M.S., 1943, in Nutrition, thorough fundamental training in chemistry. Available February 1. Experienced in vitamin assay work. Publication, white, Protestant, age 25.
Box 49-N-12, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 1615)

(Situations Wanted Continued)

CHEMIST, Ph.D., wide training and experience in Biochemistry, Food Chemistry, Physiology, Bacteriology. Employed at present, age 29, married, one son, draft 3-A. Desire permanent position with chance for advancement in essential industry.
Box 69-N-12, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D., 1941, desires research or responsible control position. Experience and background in Viscose Rayon Research, Organic and Colloid Chemistry, Mathematics, Physics and study of gas adsorption in high vacuum systems. Age 29, married, draft 3-B. Sigma Xi member.
Box 74-N-12, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST, Ph.D. Experience directing and conducting research, developing uses for new products, formulating new compounds, establishing factory production methods, and supervising control procedures. Experience with emulsifiers, emulsions, cosmetics, pharmaceuticals and allied applications. Draft status 3-A. Desire executive position in essential industry.
Box 80-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.S., age 37, 13 years' experience in heavy chemical technology, wants responsible position in chemical manufacture or control. Organizer, planner, can handle men.
Box 81-N-12, Ind. & Eng. Chem., Easton, Pa.

TEACHER, chemical engineering graduate, experienced in college chemistry and mathematics wants position in a technical school. Age 37, M.S. degree, experience in important industrial work.
Box 82-N-12, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., 1941. One year post-graduate fellowship, desires research and development position in industry. Publications. Age 35, married with dependents, deferred classification in draft. Location immaterial. References.
Box 83-N-12, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED (NONMEMBERS)

BIOCHEMIST—Ph.D. from leading midwest university. Thirteen years' experience hormone research and teaching. Many publications. Capable investigator, alert constructive thinker, executive ability, agreeable personality and appearance. Member leading professional organizations. Employed (ninth year present position) but desire change to responsible research or teaching position not necessarily in endocrine field. Age 34, married, 2 children, U. S. Citizen, 3-A.
Box 34-T-11, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, B.A., 1942, honors in chemistry. 44 hours. Desires position assistant organic research laboratory. Prefer northeastern area near university. Knowledge French, German, shorthand, typing. Protestant, single, age 20. Available December 1.
Box 17-N-12, Ind. & Eng. Chem., Easton, Pa.

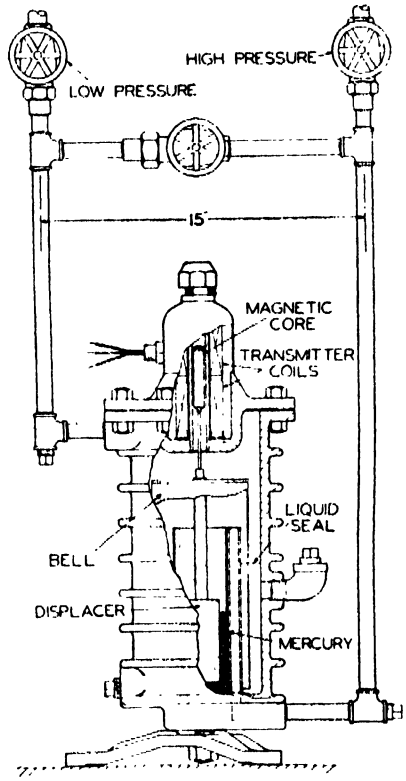
CHEMICAL RECLAIMING of metals, detinning, cleaning; metal salts and soaps; graduate chemical engineer, thirteen years' experience at research and engineering in these fields, own patents and processes. Seeks position.
Box 18-N-12, Ind. & Eng. Chem., Easton, Pa.

HORMONES WANTED: Will buy and contract for long term purchase all crystalline hormones, Folliculine, Gonadotropine, Testosterone esters, also extracts purified and solutions. Give full information, quantity, price, potencies, assays, etc.
Box 30-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, good scientific background, presently employed. Age 35, friendly alien, first papers. Best qualified for pilot plant development work, research. Wants permanent position, New York vicinity.
Box 57-N-12, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC ORGANIC Chemist, age 27, Protestant, married, one child, 3-B draft status, U. S. citizen. Have degree in chemistry from small but well recognized college. Have approximately 2 years' experience in the precipitation of organic coloring pigments, the latter 9 months of which period was spent on nearly independent research in the field. 1½ years' experience in managing own business in research on, and production of, certain pharmaceuticals during which time gained personnel and administrative experience. Have insatiable curiosity, logical mind, and intense desire to continue research in organic synthesis or to manage pilot plant operations. Desire position with firm engaged in work vital to National Defense. Prefer Middle West area, but will consider any location.
Box 62-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, at present time employed as designer for heavy machinery, several years' experience in chemical apparatus design and development work, patents along these lines, alien, first papers, F.B.I. investigation not objected, wants permanent position New York vicinity.
Box 63-N-12, Ind. & Eng. Chem., Easton, Pa.



GRADUATE CHEMIST, who detests routine laboratory analysis, desires position in development work; not too good for hard work or dirty jobs; six years' varied industrial experience. Chemical background, average. Imagination and ingenuity, above average. Draft, 3-A.
Box 68-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.S., organic-biochemical. Experienced in foods, beverages, dairy products, oils, pharmaceuticals, explosives. Research, analysis, development, and supervision of plant operations. Citizen, married, deferred. Any location if good opportunity. Immediately available.
Box 75-N-12, Ind. & Eng. Chem., Easton, Pa.

Industrial News

CONTINUED FROM PAGE 1610

Low-Pressure Flow Transmitter

THE new Cochrane Style H transmitter, used in conjunction with standard Cochrane electric meter receiving units, is designed specifically for the measurement of low static pressure gases where low differential and resultant low permanent pressure loss are of prime importance. It is a product of the Cochrane Corp., Philadelphia, Penna.

Degreasing Solvent

CYCLODIENE HYDROCARBON as a nonaqueous degreasing solvent is offered by the Technical Processes Division, Colonial Alloys Co., Philadelphia, Penna., for high-speed solvent cleaning.

THE service of the Baltimore Branch Office of the Frick Co., Waynesboro, Penna., has lately been extended to include a new district office in Washington, D. C., with W. D. Dugas in charge. A. S. Workman is manager of the Frick Branch at Baltimore.

Profusely Illustrated

233 Pages $3.85

The first compound Electron Microscope in America was developed and built in 1938 by the authors of this book, assisted by James Hillier, then a student of Dr. Burton's. Since then, news of the miraculous accomplishments of this instrument has spread rapidly through the scientific world. Actual magnifications of 67,000 diameters, permitting enlargement to over 200,000 diameters, have been attained. This enables investigators to examine organisms and colloidal particles of the order of magnitude of large molecules—an achievement whose importance in the fields of applied chemistry, bacteriology and immunology can scarcely be exaggerated.

In an informal and clear style, the book outlines the fundamental principles of optical and electron microscopes; the discussion is accompanied by many original line drawings illustrating the more important points. The dual nature of light is described in detail, and its bearing on the functioning of the electron microscope clearly shown, with emphasis on the contributions of Newton, Maxwell, deBroglie and Planck.

Many striking photographs of bacteria and of industrial materials such as asbestos, carbon black, clays and oxides will be of absorbing interest to all physicists, microscopists, chemists and biochemists.

CONTENTS

Vision. Light Microscopes. What Is Light? Wave Motion and Wave Motion Media. Wave Theory of Light Accepted. Electromagnetic Theory of Light. The Electron. Dual Theory of Light. Dual Theory of the Electron. Motion of Electrons in Electrical Fields. Electrostatic Electron Mirrors and Lenses. Magnetic Lenses. History of Electron Microscope. Electrostatic Electron Microscope. Applications of Electrostatic Electron Microscope. Compound Electron Microscope-Magnetic Type. What the Electron Microscope Can Accomplish. General Bibliography. Index.

BUSINESS OPPORTUNITIES • FOR SALE • WANTED • ETC.

MISCELLANEOUS

Five cents a word, minimum charge $2.00; display available at $10.00 per inch to be paid in advance. No discounts or allowances

MICRO-ELEMENTARY ANALYSES: C, H, N, S, P, Halogens, Methoxyl, Mol. wt., etc., U.S.P. and other official tests, Purity tests, Microinorganic assays, Spot tests, Micro-distillations, Toxicological investigations, and typical micro-chemical research work. Dr. Carl Tiedcke, 366 Fifth Avenue, New York, N. Y.

NEED EQUIPMENT? Then contact The Laboratory Exchange at New York. Write, wire or phone whatever your needs are in laboratory equipment. Your inquiry will receive immediate attention. We have served American chemistry for ten years with fine used guaranteed equipment. Reasonably priced. The Laboratory Exchange, 24 E. 21st St., New York City.

WANTED: Schwyzer, "Fabrikation der Technische und Pharmaceutisher Produkte." Want new or used copy.
Box 22-T-11, Ind. & Eng. Chem., Easton, Pa.

WANTED: 200 to 400 gallon kettle, glass lined, stainless or nickel. Either jacketed or with internal coils. Quote price, manufacturer and serial number.
Box 15-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ABSTRACTS—Volumes 5-34 (1911-1940), 5-8 in boards, 9-34 unbound, complete, good condition, for sale, best offer.
Box 26-N-12, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Excellently equipped chemical laboratory in New York, approximately 1000 square feet, live steam available, suitable for small scale production.
Box 28-N-12, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Digitonin and other digitalis glucosides are available in commercial quantities.
Box 43-N-12, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: 2,965 lbs. of Titanium Tetrachloride which passed United States Army specification No. 4-503-425. Sample available if interested.
Box 53-N-12, Ind. & Eng. Chem., Easton, Pa.

We would like to hear from individuals for firms interested in subsidising the manufacture of fine organic chemicals or specialties. Products must be vital directly or indirectly to the war effort.
Box 58-N-12, Ind. & Eng. Chem., Easton, Pa.

We wish to contact persons having complete formulae for the production of organic chemicals vital directly or indirectly to the war effort, but who do not have the chemical facilities for so producing. In answering please advise of the extent of your willingness to cooperate in finances.
Box 59-N-12, Ind. & Eng. Chem., Easton, Pa.

We desire to contact firms interested in purchasing the higher priced amino acids. Please state amounts interested in, purity desired, and approximate price you can pay.
Box 60-N-12, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Journal, American Chemical Society, ten year set, 1931-40 complete, unbound, in good condition, some covers soiled. $27.50 cash with order, F.O.B., Cambridge, Mass. Lyon Southworth, Harvard Chemical Laboratory, 12 Oxford Street, Cambridge, Mass.

DESIRED TO PURCHASE: Latest edition of Houben-Weyl, Methoden der organischen Chemie. Reply stating price.
Box 77-N-12, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Journal American Chemical Society, 12 vols. (44 to 55 incl., except no. 1, vol. 46), unbound, but in good condition. Price $27.50, F.O.B.
Box 85-N-12, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Immediate Delivery, no priorities, fully guaranteed, Standard Laboratory Equipment. (12) Spencer and B & L Microscopes, Rotary and Sliding Microtomes, Dubosq Colorimeters, Torsion Balances, Analytical Balances, Pulp Balances, (3) Schmidt & Haensch Precision Saccharimeters Double Wedge types for tubes to 400 mm. International Centrifuges, Drying Ovens, Incubators, Microscopic Accessories, Weston Voltmeters, Ammeters, etc. Leits Polarising Microscope Projection Equipment. Write for further details. Send us your lists on all Laboratory Equipment needed.
The Laboratory Exchange, 24 E. 21st St., New York, N. Y.

FOR SALE: American Journal Physiology, vols. 6, 7, 20 to 36. 58 to 117. Biological Bulletin, vols. 42 to 64. Journal Experim. Medicine, vols. 10 to 51. Transactions American Institute Mechanical Engineering, vols. 1 to 48. Zeitschrift Anorganische Chemie, vols. 40 to 53, 118 to 184, 217 to 235. Zeitschrift Physikalische Chemie, vols. 1 to 75.
Box 88-N-12, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Journal American Chemical Society 1903-33, price, $150. Industrial and Engineering Chemistry, 1909-41, with Analytical Edition, 1-13, price, $175. Unbound and in first class condition.
Box 87-N-12, Ind. & Eng. Chem., Easton, Pa.

WANTED to BUY: We are at all times interested in purchasing laboratory equipment. We are prepared to pay cash for all offerings. Write or wire us what you have to offer for immediate sale. One piece or complete laboratory.
The Laboratory Exchange, 24 E. 21st St., N. Y. C.

HIGH MELTING POINT Waxes

• Do you know that Black High Melting Point Amorphous Petroleum Waxes are available?

Do you know that these Black High Melting Point Amorphous Petroleum Waxes can be supplied in melting points ranging from 160°F. (Ball & Ring) to over 300°F. (Ball & Ring)?

Do you know that these are available in two types, one fluid on melting, the second viscous?

We will be glad to consult with you on your problems and suggest the grade and type that will be most satisfactory in the solution of your difficulties.

CHEMICAL AND ENGINEERING NEWS

HARRISON E. HOWE, Editor

PUBLISHED BY THE AMERICAN CHEMICAL SOCIETY

VOLUME 20 DECEMBER 25, 1942 NUMBER 24

Harrison Estell Howe

1881–1942

HARRISON ESTELL HOWE, for 21 years Editor of *Industrial and Engineering Chemistry*, died at his home in Washington, D. C., on December 10 in the 61st year of his life. Through his editorship and many other related activities, Dr. Howe exerted a profound influence on the development of American industry through research. Under his guidance *Industrial and Engineering Chemistry* has come to occupy a foremost place in the world's literature of industrial chemistry. Its *Analytical Edition* and CHEMICAL AND ENGINEERING NEWS were inaugurated and developed by him into outstanding publications, the latter now a journal in its own right.

The Technologic Series of AMERICAN CHEMICAL SOCIETY Monographs has grown under his editorship to an important library of chemical technology. At the time of his death he was Editor of both the Scientific and Technologic Monographs. Significant, too, has been Dr. Howe's fruitful fostering of public understanding of the vital functions of chemistry and research, particularly through the AMERICAN CHEMICAL SOCIETY News Service, of which he was Director, as well as through many other activities having similar objectives.

These services to chemists and to chemical technology earned for Dr. Howe many well-deserved honors. Honorary degrees were conferred upon him by the University of Rochester (Sc.D. 1927), Southern College (LL.D. 1934), Rose Polytechnic Institute (Eng.D. 1936), and South Dakota School of Mines (Eng.D. 1939). In 1926 he was decorated Officer of the Crown of Italy, and in 1942 was awarded the Chemical Industry Medal by the American Section of the Society of Chemical Industry. He was a fellow of the American Association for the Advancement of Science.

Harrison E. Howe was born in Georgetown, Ky., on December 15, 1881, son of William James and Mary (Scott) Howe. In 1905 he married May McCaren and their union was blessed by two daughters,

Harrison Estell Howe

Mary (Mrs. Oscar Provost) and Betty (Mrs. F. B. Clinton), who have presented him with five grandchildren.

He attended Earlham College, Richmond, Ind., where he received the B.S. degree in 1901. Subsequently he studied at the University of Michigan (1901-02) and later received the M.S. degree from the University of Rochester (1913).

His industrial career began as chemist for the Sanilac Sugar Refining Co., refiners of beet sugar at Croswell, Mich. He left this company in 1904 to join the staff of the Bausch & Lomb Optical Co., where he served in various capacities until 1916. In that year he became associated with Arthur D. Little, Inc., and its Canadian affiliate as assistant to the president and manager of the Industrial Department, respectively. During World War I he was consultant to the Nitrate Division of the Ordnance Bureau, U. S. Army. In 1919 he became chairman of the Division of Research Extension of the National Research Council, which position he left to become Editor of *Industrial and Engineering Chemistry* in December 1921. This position he held at the time of his death, and also that of Editor of CHEMICAL AND ENGINEERING NEWS.

During this active career Dr. Howe served chemistry, research, and industry in many other ways. He was a member of the Executive Board of the National Research Council for several years, beginning with the time of its founding; a trustee of Science Service; a director of the Purdue Research Foundation; and a member of the Advisory Board of the Lalor Foundation. He was chairman of the A. C. S. Committee on Cooperation with the Chemical Warfare Service and Colonel in the C. W. S. reserve. Dr. Howe was round-table and general conference leader in the Institute of Politics, Williamstown, Mass., from 1926 to 1929. He was chairman of the Chemicals Group, Priorities Division, Office of Production Management, in 1941, and subsequently chairman of the Chemical Priority Advisory Committee, WPB, as well as chairman of the Joint Committee on Miscellaneous Materials, National Academy of Sciences and National Research Council, advisory to the WPB (1941-42).

He had served as chairman of the Chemical Advisory Committee to the Department of Commerce (1926-28), chairman of the Industrial Advisory Committee to the Bureau of Industrial Alcohol (1927-30), and later as executive secretary of the Council of Industrial Alcohol Users. While with the National Research Council he took an active part in the organization of the Crop Protection Institute and the Horological Institute and in the publication of International Critical Tables, helping to secure funds and serving actively on the board of trustees. He had also been professorial lecturer in pharmacy and on scientific literature at George Washington University.

Dr. Howe was a member of many organizations and contributed much to all of them by his vigorous imagination, his

kindly humanity, and his huge capacity for work. His membership in the AMERICAN CHEMICAL SOCIETY entailed work on a long list of committees in addition to his editorial duties.

Since he joined the AMERICAN CHEMICAL SOCIETY in 1915 he had attended practically all of its national meetings, usually accompanied by Mrs. Howe. He had served as Councilor-at-Large, Divisional Chairman, Divisional Secretary, Local Section Chairman, Local Section Secretary, and Local Section Councilor.

As a member of the American Institute of Chemical Engineers he served two terms as director and represented that body on the American Engineering Council for 10 years, during eight of which he served as treasurer of the council. His clubs included the Cosmos Club, Rotary Club, Torch Club, Alpha Chi Sigma, and The Chemists' Club (New York).

Dr. Howe was a prolific writer on scientific subjects, particularly for laymen. Among his published works were: "The New Stone Age", 1921; "Profitable Science in Industry" (with three coauthors), 1924; "Chemistry in the World's Work", 1926; "Chemistry in the Home" (with Francis M. Turner), 1927; and a series of six Nature and Science Readers for school children (with E. M. Patch). He edited the two volumes of "Chemistry in Industry", 1924-25, prepared especially for use in connection with the A. C. S. Prize Essay Contest, of which he was chairman for five years. In 1930 at the request of Dr. Slosson's family he prepared the revised edition of "Creative Chemistry". He was much in demand as a lecturer on science before business men's associations, chambers of commerce, Rotary Clubs, and engineering and other professional societies all over the country.

As his principal avocation, Dr. Howe was deeply interested in Rotary International. In this organization he served in many capacities: president of the Washington, D. C., Club, governor of the 34th District, member of the Magazine Committee, and Director of Rotary International (1936-37).

Dr. Howe was always interested in people and traveled extensively. He was active in philanthropic movements and was a faithful attendant of the Calvary Baptist Church in Washington. His principal hobbies—his work might also be classed as a hobby—were gardening and photography. His homes in Washington and in Woods Hole, Mass., were surrounded by flower gardens containing many plants of prize-winning excellence, and his moving pictures and slides in color were outstanding. He also operated a farm near Richmond, Ind.

His death brought to an end a particularly fruitful and active career, and created a vacancy in American chemistry and industry that cannot be filled.

Employment of Aliens in War Industries

UNTIL comparatively recently, the employment of aliens in industry, especially war industry, was frowned upon and sometimes forbidden. Today many employers seem to be unaware that the Government's attitude in respect to the employment of aliens has been altered. This was brought out in the President's statement published under Washington dateline of July 11, 1942, and given wide circulation in the *New York Times*. That statement reads as follows:

1. Persons should not hereafter be refused employment, or persons at present employed discharged, solely on the basis of the fact that they are aliens or that they were formerly nationals of any particular foreign country. A general condemnation of any group or class of persons is unfair and dangerous to the war effort. The Federal Government is taking the necessary steps to guard against, and punish, any subversive acts by disloyal persons, citizens as well as aliens.

2. There are no legal restrictions on the employment of any person (A) in nonwar industries, and (B) even in war industries, if the particular labor is not on "classified" contracts, which include secret, confidential, restricted, and aeronautical contracts.

Contract Laws Are Stressed

The laws of the United States do provide that in certain special instances involving government contracts an employer must secure from the head of the government department concerned permission to employ aliens. Section 11 (A) of the act of June 28, 1940 (Public No. 671, 76th Congress, 3d Session), contains a provision that:

"No aliens employed by a contractor in the performance of secret, confidential, or restricted government contracts shall be permitted to have access to the plans or specifications, or the work under such contracts, or to participate in the contract trials, unless the written consent of the head of the government department concerned has first been obtained."

The Air Corps Act of 1926 has a similar provision:

"No aliens employed by a contractor for furnishing or constructing aircraft parts or aeronautical accessories for the United States shall be permitted to have access to the plans or specifications or the work under construction or to participate in the contract trials without the written consent beforehand of the secretary of the department concerned."

There are no other Federal laws which restrict the employment of aliens by private employers in national war industries. There are no federal laws restricting the employment of foreign-born citizens of any particular national origin.

3. Where, under the law, permission to employ aliens is required from the War and Navy Departments, the alien shall go to the nearest office of the United States Employment Service, which will furnish him with application form, and assist him in filling it out. The completed form will then be submitted by the alien to the employer who will fill out the reverse side of the form, and then immediately forward same to the department concerned. Upon receipt of the application, the department will act promptly thereon, in the normal case within 48 hours, and give its approval or disapproval, either of which shall be subject to change at any later time.

Special Groups Provided For

4. In passing upon applications for permits, the department will give special and expedited consideration to nationals of United Nations and friendly American Republics, and any other aliens, including enemy aliens, who come within the following categories:

A. Aliens who have served in the armed forces of the United States and have been honorably discharged.

B. Aliens who have, or who have had, members of their immediate family in the United States military service.

C. Aliens who have resided in the United States continuously since 1916 without having returned to the country of origin within the last 10 years.

D. Aliens who have married persons who, at the time of marriage, were citizens of the United States and who have resided in the United States continuously since 1924 without having returned to the country of origin within the last 10 years.

E. Aliens who have declared their intention to become citizens of the United States and who had filed petitions for naturalization before December 7, 1941.

5. Any inquiries or complaints by aliens pertaining to specific instances of discrimination, or intentional failure to carry out the above procedure, should be referred directly to the Committee on Fair Employment Practice, Washington, D. C. This committee will consider the complaints and take such action as may be warranted in the particular case.

6. Any information concerning disloyal activities in war industries or elsewhere, or indications of disloyalty on the part of persons employed in war industries, should be reported immediately to the nearest office of the Federal Bureau of Investigation. Employees have the same duty in this matter as have employers.

The AMERICAN CHEMICAL SOCIETY assumes no responsibility for the statements and opinions advanced by contributors to its publications.

C.; Telephone, Republic 5301; Cable, Jiechem (Washington). Advertising Department, 332 West 42nd St., New York, N. Y.; Telephone, Bryant 9-4430. Entered as second-class matter at the Post Office at Easton, Penna., under the act of March 3, 1879, as 24 times a year on the 10th and 25th. Acceptance for mailing at special rate of postage provided for in Section 1103, Act of October 3, 1917, authorized July 13, 1918.
Annual subscription rate, $2.00. Foreign postage to countries not in the Pan American Union, $0.60; Canadian postage, $0.20. Single copies, $0.15. Special rates to members.
No claims can be allowed for copies of journals lost in the mails unless such claims are received within 60 days of the date of issue, and no claims will be allowed for issues lost as a result of insufficient notice of change of address. (Ten days' advance notice required.) "Missing from files" cannot be accepted as the reason for honoring a claim. Charles L. Parsons, Business Manager, 1155 16th St., N. W., Washington, D. C., U. S. A.

A. C. S. Officers for 1943

HARRIS & EWING

Secretary Parsons

President-Elect Midgley, Jr.

President Frolich

ALMAN & CO.

Treasurer Baldwin

HARRIS & EWING

R. E. Swain

W. A. Schmidt

HARRIS & EWING

L. H. Adams

M. L. Crossley

R. L. Shriner

W. Albert Noyes, Jr. V. du Vigneaud, Jr.

THE following officers of the AMERICAN CHEMICAL SOCIETY for 1943 have been elected: President-Elect, Thomas Midgley, Jr.; Director, fourth district, L. H. Adams; Director, sixth district, R. E. Swain; Director-at-Large, Walter A. Schmidt; Councilors-at-Large, M. L. Crossley, Vincent du Vigneaud, W. Albert Noyes, Jr., and R. L. Shriner.

Per K. Frolich, President-Elect during the current year, and now President of the AMERICAN CHEMICAL SOCIETY, is director, Chemical Division, Esso Laboratories, Standard Oil Development Co., Elizabeth, N. J. He has included among his SOCIETY activities during the past several years the chairmanship of the North Jersey Section and of the Division of Petroleum Chemistry, as well as a term as Councilor-at-Large. (See more detailed account on page 1620.)

Thomas Midgley, Jr., newly chosen President-Elect, is vice president of the Ethyl Corp. and of Kinetic Chemicals, Inc., as well as director of the Ethyl-Dow Corp. Dr. Midgley has served as a Director of the AMERICAN CHEMICAL SOCIETY since 1930 and as chairman of the board since 1934. He has been recipient of the Nichols Medal of the AMERICAN CHEMICAL SOCIETY, the Willard Gibbs Medal of the Chicago Section, and the Priestley Medal.

As for the newly elected Directors, **L. H. Adams** and **W. A. Schmidt** have previously been national Directors, Local Section Chairmen, and Local Section Councilors of the AMERICAN CHEMICAL SOCIETY. **R. E. Swain** has served in these capacities, and also as Divisional Chairman.

Of those chosen to be Councilors-at-Large of the SOCIETY, **M. L. Crossley** has been Local Section Chairman; **Vincent du Vigneaud** has been Local Section Councilor as well as a member of committees of the AMERICAN CHEMICAL SOCIETY; **W. Albert Noyes, Jr.**, has been Councilor, assistant editor of *Chemical Abstracts*, and Divisional Chairman; and **R. L. Shriner** has served in turn as Divisional Chairman, Local Section Secretary, and Local Section Councilor.

Thank You

WE WOULD like very much to reprint the many telegrams, resolutions, and letters that are pouring into the office relative to the death of our esteemed late Editor, Harrison E. Howe, but space limitations forbid. These messages are all deeply appreciated by Dr. Howe's family, and by the editorial staff.

Hotel Reservations

Detroit Meeting

THE hotel committee of the Detroit Section of the AMERICAN CHEMICAL SOCIETY strongly requests that members planning to attend the spring meeting, April 12 to 16, 1943, make all hotel reservations through it.

Full particulars including names of hotels and rates will appear in the January 10, 1943, issue of CHEMICAL AND ENGINEERING NEWS.

Double occupancy of rooms is essential to relieve congestion.

Per K. Frolich

A. C. S. President, 1943

On January 1, 1943, Per K. Frolich will succeed Harry N. Holmes as President of the American Chemical Society, the largest professional organization of its kind in the world. Taking office at 43, he is the youngest man to serve as President of the Society in more than 30 years and is the first representative from the petroleum industry elected to the presidency.

Born in Norway, 1899, Dr. Frolich obtained his undergraduate training at the Norway Institute of Technology from which he was graduated in 1921 with a B.S. degree. He was originally trained as an electrochemist, and early in his undergraduate work so favorably impressed his instructors that he was given an assistantship in chemistry in 1919 and again in 1920.

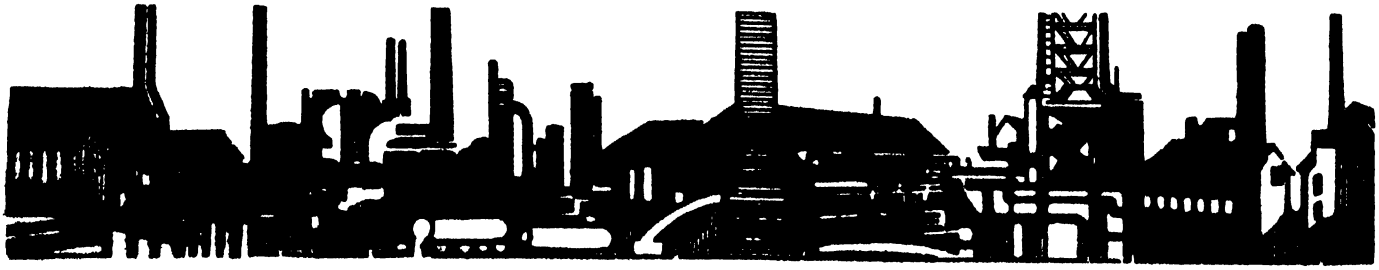
In 1922 Dr. Frolich accepted an American-Scandinavian Foundation fellowship for graduate work at the Massachusetts Institute of Technology. There was little to indicate that this young man from Norway, who had crossed the Atlantic for graduate work in electrochemistry and chemical engineering, would, 20 years later, contribute so greatly to the war effort of his adopted country. According to his instructors at M. I. T., his work in the classroom and laboratory was characterized by quiet effectiveness, and he impressed all those with whom he came in contact as being thoroughly grounded in the fundamentals of his chosen science. He received his M.S. degree in 1923 and was given a research assistantship so that he could continue his advanced studies for his doctorate. After receiving his doctor's degree in 1925, he remained at M. I. T. as research associate, became assistant professor of chemical engineering in 1927 and associate professor in 1929. From 1927 to 1929 he served as assistant director of the Research Laboratory of Applied Chemistry.

His early participation in the vigorous forms of athletics for which his native land is noted helped to build up the splendid physique which permitted him to carry on such a wide variety of research activities along with his teaching duties. During the period 1922 to 1930, he had published some 30 scientific papers covering the general field of electrochemistry, high-pressure synthesis, and the role of catalysts in high-pressure reactions. His work in this latter field received world-wide recognition and, in 1930, he was awarded the Grasselli medal by the Society of Chemical Industry for his work on gas reactions carried out under high pressure.

Although Dr. Frolich was keenly interested in research and teaching, he was at all times the practical scientist and became increasingly interested in the industrial development of the many problems on which he had carried out basic research. In 1929 he joined the research staff of the Standard Oil Development Co. His outstanding ability was quickly recognized and he advanced rapidly, becoming assistant director of the Research Laboratories in 1931 and director in 1933. On account of the rapidly expanding research programs of the Development Co., it became necessary to segregate the chemical and purely oil research activities, and in 1935 Dr. Frolich was appointed chief chemist of the Standard Oil Development Co. and in 1936 became director of the new Chemical Division of the Esso Laboratories.

Under his direction, the chemical activities of the Development Co. have been expanded and have covered a wide variety of investigations including various types of lube oil additives, the chemical utilization of refinery gases, high-pressure oxidation, synthesis of both low and high molecular weight polymers from petroleum gases, synthetic rubber raw materials, and synthetic rubbers. One of the outstanding contributions of the Esso Laboratories-Chemical Division has been the development of Butyl rubber which finds so many uses in our war effort. Dr. Frolich and his associates have also developed improved methods for the production of butadiene and other synthetic rubber raw materials, and have made available to various industries the "know how" of the Buna rubbers.

Always a believer in cooperative effort, Dr. Frolich was quick to recognize the role of the American Chemical Society in furthering the chemical industry in the United States. He has been active in the councils of the Society and served as vice chairman and chairman of the North Jersey Section in 1933 and 1934. From 1936 through 1938 he was vice chairman of the Petroleum Division and chairman from 1938 to 1940. In 1940 he was elected councilor at large.



He has also found time to be an active member of the American Institute of Chemical Engineers, American Society of Automotive Engineers, the Society of Chemical Industry, the Chemical Society and the Chemists' Club. In spite of his industrial duties, he has contributed to various scientific societies some 50 technical papers. He also holds approximately 50 patents issued or applied for.

It is a tribute to Dr. Frolich's tremendous energy that his accomplishments in his chosen field have not prevented his becoming an outstanding American, keenly interested in civic activities and in various sports.

National Conference of Electron Microscopy Formed

R. Bowling Barnes, of the Stamford Research Laboratories of American Cyanamid Co., was elected first president of the National Conference of Electron Microscopy formed by leading workers in this field meeting at the National Chemical Exposition, Chicago, November 27 to 28. Albert F. Prebus, of Ohio State University, was elected vice president of the new organization, and Charles Banca, of R. C. A. Manufacturing Co., Camden, N. J., its secretary-treasurer. V. K. Zworykin, of the R. C. A. organization, and O. S. Duffendach, University of Michigan, were elected to serve with the officers of the conference as its directors.

G. L. Clark, University of Illinois, presided at the formation meeting. Dr. Clark, L. S. Matheson, Dow Chemical Co., and Dr. Duffendach constituted the committee which called and arranged the initial conference.

Directors' Minutes

The Board of Directors of the American Chemical Society met at the home of Thomas Midgley, Jr., in Worthington, Ohio, at 10:00 A. M., Saturday, November 28, 1942. Thomas Midgley, Jr., Chairman of the Board, presided and the following Directors were present: L. H. Adams, Robert T. Baldwin, William Lloyd Evans, Per K. Frolich, Arthur J. Hill, Harry N. Holmes, Charles L. Parsons, R. E. Swain, Charles A. Thomas, and Edward R. Weidlein.

It was moved, seconded, and carried that the minutes of the previous meeting be approved.

A short report from the Finance Committee was read, approved, and ordered placed on file.

The Secretary gave a verbal report on the progress of the Society, briefly summarized as follows:

Ad Interim Report of the Secretary and Business Manager

The House of Representatives of the Congress of the United States has passed Bill 7781, being the legislation to which reference was made on page 1091 of Chemical and Engineering News, September 10, 1942, which legislation concerns taxation of the real estate in Washington, D. C., belonging to the American Chemical Society. An identical bill has been approved by a Senate Committee. It is on the calendar and its passage prior to the adjournment of Congress is expected.

Censorship problems have occupied many hours of the time of both the Secretary and the Editors, but with the exception of limitations placed upon the circulation of *Chemical Abstracts* and other journals (for details see Chemical and Engineering News, page 783, June 25, 1942), our journals are being circulated quite freely. We are giving full cooperation to the Office of Censorship and are receiving courteous and considerate treatment in return.

As of November 25, 1942, 4,286 new members have joined the Society in the current year, and on the same date the membership total had increased to 31,707.

There was a loss in foreign circulation in 1942 to the extent of 715 subscriptions to the *Journal of the American Chemical Society*, 785 to *Chemical Abstracts*, 1,439 to *Industrial and Engineering Chemistry* and 1,148 to Chemical and Engineering News, but domestic subscriptions had increased so that net decrease in subscriptions to the *Journal of the American Chemical Society* is 85, and *Chemical Abstracts*, 636; on the other hand, *Industrial and Engineering Chemistry* shows a net increase of 464 paid subscriptions and Chemical and Engineering News an increase of 1,905.

The most important income item has been the large increase in advertising receipts which, in spite of the increased cost of publication and administration, will again enable the Society to show a surplus in 1942.

The Secretary's office has continued to be very active in attempting to keep chemists and chemical engineers where they can best serve the country, in the production army. Selective Service has been very cooperative as it fully understands, and has certified to, the acute shortage of this type of manpower. With very few exceptions, which have not been the fault of Selective Service administrators, chemists and chemical engineers have been retained where their services can be utilized to the best advantage for America. It is a duty and a pleasure to testify to the devotion to duty of the officials of the Selective Service System and to their intelligence and efficiency in handling a problem which at times is complex. If the Local Boards were equally well informed, many chemists and chemical engineers who are now in the combat army would be rendering far greater service to their country as essential men in its production army. In this connection, the Society calls again to the attention of the members the fact that Occupational Bulletins 10, 23, and 24 are available in planographed form with outlined procedure which, if followed from the early stages of faulty classification, will be found helpful in obtaining occupational deferment for those who should be retained in the production army.

The Secretary's report which will appear probably in the February 25, 1943, issue of Chemical and Engineering News will give a complete summary of the year's accomplishments.

Charles L. Parsons,
Secretary and Business Manager

Charles L. Parsons was re-elected Secretary and Business Manager.

Robert T. Baldwin was re-elected Treasurer.

The Finance Committee, consisting of Robert T. Baldwin (Chairman), William Callan, C. R. DeLong, Thomas Midgley, Jr., and Robert E. Wilson, was re-elected.

The following resolution was passed unanimously:

Whereas, a communication dated October 15, 1942, from Atherton Seidell to the Board of Directors of the American Chemical Society offers to assign to the American Chemical Society all rights to any future profits derived from the sale of the third edition of his book, "Solubilities", Volume I, Inorganic and Metal Organic Compounds, and Volume II, Organic Compounds, without obligation of any kind on the part of the American Chemical Society as to the future publication of this work or the disposition of the profits, estimated at several thousand dollars, derived therefrom, but with the expressed hope that the American Chemical Society may utilize these funds in the determination and publication of physical data;

Therefore, Be It Resolved, that the Board of Directors on behalf of the American Chemical Society accepts with appreciation the offer of Atherton Seidell as a contribution to the advancement of chemistry, which is quite in accord with the present activities of the Society in sponsoring monographs on chemical subjects and collecting and abstracting the literature of chemistry.

As the meeting of the American Chemical Society at Detroit, Mich., April 12 to 16, 1943, is being held specifically to enable chemists and chemical engineers to gather and hold conferences relating especially to problems connected with the war endeavor, it was moved, seconded, and carried that the Secretary be instructed to inform the Detroit Local Section that, in the opinion of the Directors, since the meeting has been called basically for the purpose of discussing the advancement of chemistry and its relation to the war activity, all extraneous entertainment, trips, and unnecessary details be omitted except for the banquet and group meals.

A statement of the activities of the Committee on the Professional Training of Chemists, including plans for 1943, was accepted and ordered placed on file.

It was moved, seconded, and carried that the Secretary be instructed to send to the Committee on the Professional Training of Chemists an expression of the Directors' appreciation for the excellent work which it is doing and for the results accomplished.

A statement received from the Committee on Patent and Related Legislation was read, accepted, and ordered placed on file.

It was moved, seconded, and carried that the Secretary be instructed to send to the Committee on Patent and Related Legislation the sincere appreciation of the Board of Directors for the active and satisfactory way in which the committee functioned during 1942.

A report on the activities of the Committee on Economic Status was presented, approved, and ordered placed on file.

It was moved, seconded, and carried that the Secretary be instructed to send to the Committee on Economic Status a communication expressing the appreciation of the Directors for the excellent results which have been and are being accomplished by this committee.

The Committee on Chemical Service to Medicine reported favorable progress but had no final conclusions to record. This

report was accepted and ordered placed on file.

Statements were received from the Editors of the SOCIETY's journals and from the Manager of the Advertising Department. These statements were accepted and ordered placed on file.

The Secretary presented to the Board of Directors correspondence with three members of the SOCIETY, employees of the Aluminum Ore Co. of East St. Louis, Ill., who claimed that they had been compelled to join the Aluminum Administrative Workers Union, Local 20061. The Secretary also presented correspondence with the Union and with the Personnel Director of the Aluminum Ore Co., and gave a report of a conference on the matter which had been held in Washington by the President of the Local, Frank E. Morton, the Secretary of the SOCIETY and the SOCIETY's Counsel, Elisha Hanson. It was moved, seconded, and carried that the letter of October 7 written by the Secretary to the Personnel Director of the Aluminum Ore Co. be spread on the record for the information of the SOCIETY's membership. Omitting the names of the three members nvolved, the letter follows:

Mr. Ian D. Marsh, Personnel Director,
Aluminum Ore Co.,
East St. Louis, Ill.

Dear Mr. Marsh:

Question has arisen between the AMERICAN CHEMICAL SOCIETY and Local 20061 of the Aluminum Administrative Workers Union in respect of the professional or nonprofessional status of three empolyees of the Aluminum Ore Co. at East St. Louis, Ill.

If these men were employed as professional chemists and are now engaged in their profession, they are not susceptible of membership in Aluminum Administrative Workers Union, Local 20061, and Mr. Morton, the president of the Union, has so agreed in a conference with me today. If, on the other hand, these men are not engaged in professional work, then the AMERICAN CHEMICAL SOCIETY has no objection to their belonging to a union made up of various types of administrative workers. Therefore, in order that the matter be adjusted between the Union and the SOCIETY, it is necessary for us to have a report from the company as to the classification of these men and the nature of the work they are performing, particularly as to whether their work is professional or nonprofessional in character. Both the SOCIETY and the Union have agreed to abide by your statement as to the professional or nonprofessional character of their work as the basis for the adjustment of the situation.

I am sending a copy of this letter to Mr. Morton, and I trust that you will send to him a copy of your reply to me.

Very truly yours,

CHARLES L. PARSONS, *Secretary*

The Directors expressed gratification that this Local of the Aluminum Administrative Workers Union adhered strictly to the understanding between the AMERICAN CHEMICAL SOCIETY and William Green, President of the American Federation of Labor (see NEWS EDITION, 17, No. 7, page 249, April 10, 1939), and to the recommendations of the National Labor Relations Board (see CHEMICAL AND ENGINEERING NEWS, 20, No. 3, page 165, February 10, 1942).

The Directors discussed at some length suggestions made by responsible parties to modify their recommendations for minimum salaries paid to chemists and chemical engineers, as enunciated in "Employer-Employee Relationships for Professional Chemists as Recommended by the American Chemical Society" adopted at the Atlantic City meeting (NEWS EDITION, 19, No. 18, page 1014, September 25, 1941). It was moved, seconded, and carried that for new employees the recommended minima be increased $300 a year in each category, and further that such increased minima be applied to present employees insofar as it is possible for employers to make such increases for present employees under the economic stabilization program of the Government.

After discussion, it was moved, seconded, and carried that the following budget for 1943 be passed:

Estimated Income, 1943

Dues	$280,000.00
Subscriptions	200,000.00
Back Numbers	7,000.00
Postage	10,000.00
Interest	14,500.00
Interest from Endowment Fund	3,000.00
Royalties	3,000.00
Advertising	279,000.00
TOTAL	796,500.00

Estimated Expenditures, 1943

Journal of the American Chemical Society	$ 71,000.00
Chemical Abstracts	187,800.00
Industrial and Engineering Chemistry including *Analytical Edition*	179,500.00
CHEMICAL AND ENGINEERING NEWS	76,900.00
News Service	8,400.00
Secretary and Business Manager's Office:	
Secretarial	29,200.00
Business Management	43,800.00
Treasurer's Office	10,700.00
President's Office	1,500.00
Printing Advertising	100,000.00
Advertising Development	14,055.00
Monographs	1,025.00
Back Numbers	6,000.00
Local Sections	33,000.00
Incidentals	12,600.00
Legal	2,400.00
Special Committees	13,000.00
General Meetings	2,000.00
Employment Clearing House	2,700.00
Total Estimated Expenditures	795,580.00
Surplus	920.00
TOTAL	796,500.00
Fourth Decennial Index	3,000.00

It was moved, seconded, and carried that $40,000, derived from any available surplus and/or from funds not otherwise appropriated, be and is hereby ordered set up as a reserve to be applied against the investment in land and buildings in Washington, D. C., and that the Treasurer be and is hereby authorized and instructed to proceed accordingly.

It was moved, seconded, and carried that $40,000, derived from any available surplus and/or from funds not otherwise appropriated, be transferred to "Decennial Index Fund", and that the Treasurer be and is hereby authorized and instructed to proceed accordingly.

It was moved, seconded, and carried that the income from the Permanent Endowment Fund for 1942 be transferred to the *Chemical Abstracts* Fund.

It was moved, seconded, and carried, subject to approval by Counsel, that additional compensation to the amount of 10 per cent of the salary received during 1942 but not to exceed $200 be given to each clerical and editorial employee of the AMERICAN CHEMICAL SOCIETY employed for not less than three months in 1942 who received less than $5,000 per annum for such services; and the Treasurer be and is hereby authorized and instructed to make the necessary expenditure from funds not otherwise appropriated.

A unanimous vote of appreciation was extended to Mrs. Thomas Midgley, Jr., and the Chairman of the Board for their hospitality.

All motions were carried unanimously.

There being no further business, the meeting was adjourned at 5:00 P. M.

CHARLES L. PARSONS, *Secretary*

Fund for Nutrition Research

THE Nutrition Foundation, Inc., Chicago, Ill., has received a total of $1,001,000 from a group of food and related manufacturers, to support a 5-year program of basic research in the science of nutrition.

President Harry N. Holmes of the AMERICAN CHEMICAL SOCIETY has been elected an honorary member of the Chemical, Metallurgical, and Mining Society of South Africa.

Raymond Vaughn, is now assistant professor of chemistry at Southeastern University, Memphis, Tenn. For the past three years he was engaged in graduate work at the University of Missouri, holding a teaching fellowship in chemistry.

Calvin Yoran, until recently associated with the Featheredge Rubber Co., Chicago, Ill., has joined the staff of the Research Laboratory, Wishnick-Tumpeer, Inc., as chief chemist.

Harry N. Holmes and Richard Remsen Holmes

To the 32,000 members of the A. C. S. it is not news that the highest honor this group of chemists can bestow upon one of its members is to make him President of the American Chemical Society—the largest specific scientific body in the world. But it may be news to some that **President Harry Nicholls Holmes,** whose term expires this month, is the product of and protagonist for the liberal arts college. Although repeatedly offered attractive positions in large universities and in industrial organizations, he has steadfastly but courteously refused them, preferring to remain in Oberlin College, where he has been head of the Department of Chemistry since 1914. There and at Earlham College, where he was head of the Department of Chemistry from 1907 to 1914, he has taught over 4,000 liberal arts college students and influenced more than 300 in becoming professional chemists. In view of his notable achievements and his valuable contributions, both in research and in scientific education, his lifetime association with liberal arts colleges needs added emphasis, particularly now, when many of the smaller colleges, though exceedingly eager and qualified to be of the utmost service, may be ignored or even denied the opportunity of helping to train young people for the immediate demands of the national emergency. Dr. Holmes epitomizes the great contribution which the liberal arts colleges have made to the development of America and the democratic way of life.

Born July 10, 1879, near New Castle, Penna., of Scotch-Irish-English parentage and constantly encouraged by his revered mother, who taught him perseverance and economy, he overcame the handicaps of meager funds and secured a college education at Westminster College (A.B. 1899, M.S. 1907, LL.D. 1941), and his first love for chemistry under the inspiring teacher, Charles C. Freeman.

With the aid of funds saved while teaching at Gallia Academy, Gallipolis, Ohio, and at Dixon Academy, near New Orleans, he realized his ambition to do graduate work at Johns Hopkins University (Ph.D. 1907). Here Ira Remsen, "the perfect teacher, taught him clearness in writing and thinking and a devotion to research", and did for Dr. Holmes what the latter has so freely passed on to his many students—helped him to secure subsequent positions.

Two years after assuming his duties at Earlham College, Dr. Holmes married Mary V. Shiveley, of Richmond, Ind., the daughter of a lawyer prominent in the State of Indiana. They have two sons, Charles, instructor in English, Pomona College, and Richard Remsen, concerning whom more will be told.

So versatile and vigorous has Dr. Holmes been that a cataloging of his activities resembles a listing of the achievements of "Superman": a basketball star and coach who introduced the game at Johns Hopkins, captained and coached the team, and twice produced the best college team in Indiana while coaching, on the side, at Earlham College; a golfer and instructor of his two sons, who now surpass him (he has been good enough to win a first prize in an A. C. S. tournament); a musician—not instrumental but vocal—member of Johns Hopkins Quartette, Glee Club, and several prominent choirs; an actor of no mean ability—he participated in numerous dramatic productions by the faculty at Oberlin; a handwriting expert, who has occasionally been expert witness in legal cases; a lover and grower of beautiful flowers, who knows just what fertilizers to use and proper pH of the soil for best results; an able administrator, who has given an international reputation to the Chemistry Department at Oberlin, as well as expanded it until every nook and cranny of the laboratory building is utilized; an organizer of regional groups of chemists in Ohio and surrounding states and one of the founders of Gamma Alpha Graduate Scientific Fraternity; the first editor of *Gamma Alpha Record;* a wide disseminator of science knowledge by means of air waves and talks before Service Clubs and P. T. A. groups; a research consultant to industrial organizations; the holder of several patents; a traveler, who made trips to Europe with his family in 1926 and 1934 (and as President of our Society has traveled over 25,000 miles!); a great exponent of vitamins, particularly partial to vitamin C; the distinguished author of eleven books, concerning the third edition of whose book "Out of the Test Tube" one reviewer wrote:

> Fortunately for the public, there are a few consummate artists among those who write on scientific subjects. In the forefront of these stands Dr. Harry N. Holmes. Chemistry is fortunate to have in its ranks a spokesman with his literary talents. In a direct, honest, clear pictorial style he presents his science in a manner that is not only informative and educational but as entertaining as many books that are read for diversion. With "Out of the Test Tube" and Dr. Holmes' latest textbook on chemistry under his arm, a high school or college student is prepared to learn chemistry and like it. While either of these volumes will stimulate his interest in the subject, there is grave peril that together they might be sufficient to make him want to be a chemist.

a lecturer extraordinary; an indefatigable investigator, who has published more than fifty research papers; a great crusader for research in colleges, who has set the pace at Oberlin, since no other college in the United States equals that institution in published research; and an inspiring teacher, who has not only trained many who are now distinguished industrial chemists or widely known teachers, but has made chemistry an interesting and exciting subject to English, Latin, economics, and history majors.

Possibly the accomplishments listed above could be achieved by a man who is indifferent to others, though this is not probable. However, a recital of his many accomplishments does not reveal the real man and his warmth of friendship nor his deep personal interest in his students, past and present. He is always on the lookout for good positions for them—not for just one or two particular favorites, but for all whom he can wholeheartedly recommend. He is not sentimental, but his love for and devotion to his students are genuine. This has its own reward, for his students reciprocate this love and loyalty (look in on an Oberlin breakfast at any of the A. C. S. meetings). On the occasion of the completion of 25 years as head of the Department of Chemistry at Ober-

lin College, his students gave a dinner in his honor at the A. C. S. meeting in Boston, September 1939. The eagerness of all to have a part in this celebration and tribute to a great teacher and friend was overwhelming. They presented him with a beautiful gold watch, appropriately engraved, and a handsomely bound book of letters of appreciation. Possibly in no more fitting way could this tribute to a great scientist, teacher, and friend be concluded than by quoting a paragraph from one of his former students:

Although I did not major in chemistry, nor do graduate work under Dr. Holmes, the lectures and demonstrations in his elementary chemistry class are among the most vivid and pleasant recollections of my undergraduate career and I still regard the course I took with him as one of the most profitable and illuminating academic experiences I have ever had. The fact that a man of his specialized training and national reputation should have made the elementary class of his department one of his chief interests has always seemed to me to be the best evidence of his sincere interest in teaching. It has also marked him for me as a truly great scientist, one who realizes that his duty is not merely to advance science's frontiers but also to give intelligent laymen, and possibly laymen not too intelligent, some inkling of the methods and discipline of science and of its promise to civilization.

Richard Remsen Holmes

Born August 21, 1920, in Oberlin, Ohio, he was named for the man whom his father so greatly admired—Ira Remsen. When Dick was about seven years old Remsen visited Oberlin and his eyes twinkled as he watched his "grand-pupil" and namesake.

Dick attended Deerfield Academy, Deerfield, Mass., and then returned to Oberlin College, completing work for graduation, with honors in chemistry, in September 1942. At once (October 15, 1942) he began work as junior chemist with the Shell Oil Development Co., Emeryville, Calif., taking with him his wife, Virginia Shaw Holmes, whom he married before completing the requirements for graduation. This required special permission, according to regulations of Oberlin College.

In 1942 Dick won the golf championship of the Ohio College Conference. In 1940 he pushed the finalist winner of the Cleveland District Junior Championship to the 36th hole.

From reliable sources it is reported that Dick's father brought no pressure on his younger son to become a chemist, but there was paternal delight when Dick indicated his desire to follow in his father's footsteps. Nor in any way did Dick seek any favoritism because of his relationship to the head of the department. Apparently both he and his father leaned over backwards in this respect, thus forming a V for Victory.

For his senior honors thesis Dick worked with his father on "Pencillin", an extraordinarily difficult problem. Dick modestly thinks he did little, but his father insists he showed the originality and accuracy of a first-class graduate student.

Naturally, he took his father's course in colloid chemistry as well as some of his vitamin C. After the war Dick plans to go on for his Ph.D., probably in the field of organic or biochemistry, since these are his favorites.

PAUL H. FALL

Remington Medal Presentation

JOSIAH K. LILLY, chairman of the board of Eli Lilly and Co., received the Remington Medal for distinguished work in pharmacy at a meeting in New York on December 10. The medal was presented by Curt P. Wimmer, vice president of the New York branch of the American Pharmaceutical Association, which sponsored the event. More than four hundred leaders of the industry were present.

Mildred Adams, who for several years has been in the chemical research division of the National Institute of Health, Washington, D. C., has taken a position with Takamine Laboratories at Clifton, N. J.

Adrian G. Allison, former ceramic engineer of the Electro Refractories & Alloys Corp., Buffalo, N. Y., has been appointed to the research staff of the Battelle Memorial Institute, Columbus, Ohio, and assigned to the Division of Ceramic Research.

William T. Anderson, Jr., for nearly 20 years director of the radiation research laboratory of the Hanovia Chemical and Manufacturing Co., Newark, N. J., has been granted a leave of absence to accept a commission as a lieutenant in the Naval Reserve.

James R. Arthur, assistant to comptroller of the Tobacco By-Products & Chemical Corp., Louisville, Ky., and **Charles M. Timblin,** auditor of Charles Pfizer & Co., Inc., New York, have been elected to membership in the Controllers Institute of America, a technical and professional organization of controllers devoted to improvement of controllership procedure.

Edward J. Barta, ordered to active duty December 30, 1940, as Chemical Warfare Officer, Armored Force Board, Fort Knox, Ky., was promoted to major on July 25, 1941, and to lieutenant colonel on August 31, 1941. He has now been relieved from duty at Fort Knox and assigned to Headquarters II Armored Corps as Corps Chemical Officer, Camp Young, Calif.

George M. Bramann has resigned as assistant to the sales manager of the Niacet Chemical Corp. and accepted the position of plant investment engineer with the Magnesium Plant, Mathieson Alkali Works, Lake Charles, La.

Harold W. Coles, formerly of Mellon Institute, has joined the research staff of the Bausch & Lomb Optical Co., Rochester, N. Y., where he will be in charge of the new Organic Chemistry Department.

Charles A. Cook, formerly senior biochemist at the Experimental Research Laboratories, Burroughs Wellcome and Co. (U. S. A.), is now in charge of the department of medical and biological chemistry at the Research Laboratories of the Lambert Pharmacal Co., St. Louis, Mo.

Ned H. Dearborn, executive vice president of the National Safety Council, **Philip Drinker,** Harvard School of Public Health, **Lieut. Col. A. J. Lanza,** chief, Occupational Hygiene Branch, U. S. Army, and **C. D. Selby,** General Motors Corp., have been elected to the board of trustees of the Industrial Hygiene Foundation.

Ogden FitzSimons has joined the General Engineering Department of Monsanto Chemical Co. and will be located in St. Louis, Mo. Mr. FitzSimons was formerly with The Barrett Division, Allied Chemical and Dye Corp.

Thomas S. Gardner, duPont Postdoctoral Fellow in Cellulose, 1941–42, Massachusetts Institute of Technology, Cambridge, Mass., has joined the staff of the Tennessee Eastman Corp., Kingsport, Tenn., as a research chemist.

Esther Griffith, formerly on the teaching staff of Texas State College for Women at Denton, Tex., has taken a position in industrial research with Devoe and Raynolds Co., Louisville, Ky.

POTOMAC POSTSCRIPTS

WPB Activities

Alcohol. To save an additional million gallons of ethyl alcohol a year for military production, use of alcohol in toiletries and cosmetics, shoe polishes, candy glazes, and nonbody deodorant sprays will be limited to 50 per cent of the amount used in a base period by General Preference Order M-30, as amended by the Director General for Operations.

Under the original order use of alcohol was restricted to 70 per cent of the base period for certain cosmetics and toiletries, while for others the permitted use was 100 per cent of the base period amount. The amended order limits quarterly consumption of alcohol to 50 per cent of consumption in the comparable quarter in the fiscal year ended June 30, 1941. For the month of December 1942, use of alcohol is limited to 50 per cent of the amount used in December 1940, and total fourth-quarter consumption may not exceed 70 per cent of consumption in the corresponding quarter in the base period.

Chlorine. Restrictions on the use of chlorine and products containing available chlorine have been revised to remove from control of Conservation Order M-19 all products containing available chlorine such as liquid sodium hypochlorite, calcium hypochlorite, and sodium chlorite. Also exempted from the order, as amended, are deliveries and use of 2,000 tons of chlorine or less per month.

Fertilizers. A grade-substitution program expected to reduce the consumption of chemical nitrogen in mixed fertilizers by approximately 20 per cent has been instituted by the Director General for Operations through issuance of General Preference Order M-231 as amended. Through this program a large amount of nitrogen will be saved without greatly impairing crop production.

Schedule B of the amended order lists the grades of fertilizer by nitrogen content used during the 1940–41 season in the respective states. Opposite these are the approved grades which are to be substituted in 1942–43. Fertilizer manufacturers are required to produce the approved 1942–43 grades in the same proportion as the 1940–41 grades. The amended order also places manufacturers on the same basis as dealers and agents in respect to stocks on hand. That is, manufacturers may now deliver stocks of fertilizer packaged in lots of less than 80 pounds. Previously they were required to reprocess these stocks into approved grades and repack them in 100-pound bags.

Graphite. Complete control over distribution and use of graphite will be effected by Conservation Order N-61, as amended by the Director General for Operations. Madagascar flake graphite alone was covered by the previous order. The amendment extends this control to a lower-grade than previously covered and brings into control all graphite which will stand on a number 50-mesh screen.

Beginning immediately no person may put into process for any purpose any strategic graphite except with specific authorization by WPB. No person except a jobber may deliver or accept delivery of any crucible, or any other product containing strategic graphite, without specific authorization. Preference ratings will hereafter have no bearing on delivery of crucibles containing strategic graphite.

Lithium. Lithium ores have been put under complete allocation and use control by General Conservation Order M-253, issued by the Director General for Operations. Beginning immediately, no supplier may deliver and no consumer may accept delivery of, or use, lithium ores except with specific authorization of WPB. This restriction covers stocks of ore which have been produced and are now in private or government hands, including spodumene, lepidolite, amblygonite, triphylite, petalite, and zinnwaldite. Allocations will be made without regard to preference ratings. Forms PD-728 and PD-729 are to be filled with WPB in connection with this order.

Lithium compounds are under allocation control by Order M-190. The operation of newly constructed production facilities is placing substantial new burdens on lithium ore supply. The new order is issued to ensure an orderly and complete regulation of all phases of lithium compounds manufacture. It is estimated that more than 300 tons of spodumene a month may be directed into war production as a result of the order.

Sulfuric Acid, including oleum and spent acid, has been placed under allocation control through the issuance by the Director General for Operations of General Preference Order M-257. Deliveries of acid will not be prohibited subject to specific authorization, as is usually the case with an allocation order, but directions will be issued when and as needed, covering deliveries to be made and uses to be permitted or prohibited.

The order is prompted by the need of a continuous supply of sulfuric acid to fulfill military explosives requirements, and will enable the Chemicals Division of the War Production Board to act promptly in emergencies. It provides that all producers of sulfuric acid, and all others who deliver spent sulfuric acid, must file monthly reports covering their shipments and production during the prior month, as well as a statement of estimated production for the current month. This report is to be made on the standard chemical supplier's form, PD-601.

Theobromine and Caffeine. Procedures for filing reports under Order M-222 covering theobromine and caffeine have been changed by issuance of an amended order by the Director General for Operations. Under the amended order three copies, rather than two, of the customer's application, Form PD-600, must be filed with WPB. Also the interval is reduced between the filing of the customer's and supplier's application. The amended order does not change the actual distribution of materials.

Vegetable Fats and Oils. Importers of vegetable fats and oils have been notified of a revision in the schedule of commodities and consideration days under which the Commodity Credit Corporation considers offers submitted to sell fats, oils, and oil-bearing materials for importation under provisions of WPB General Imports Order M-63. The new schedule, effective December 2, 1942, is a revision of the schedule announced October 20, 1942.

Jointly announced by the Board of Economic Warfare, the WPB, and the CCC, the revised schedule changes consideration days for offers from a Tuesday-Friday basis to Tuesdays only. On Tuesdays, the CCC will consider offers of the following commodities, if received by 4:00 P.M. EWT, by the Director of Foreign Purchases, Commodity Credit Corporation, U. S. Department of Agriculture, Washington, D. C.: babassu oil, babassu kernels, cashew nut shell oil, castor oil, castor seed, coconut oil, copra, corn oil, cottonseed oil, oiticica oil, palm kernels, palm kernel oil, palm oil, peanut oil, rapeseed oil, and sunflower seed oil.

Because offers by the trade were so small on muru muru oil, neatsfoot oil, ouricury oil, and tucum oil, these commodities, which were on the list announced October 20, were not included in the current list. No change is made in the procedure announced August 18, 1942, under which importers submit offers to the CCC.

Price Regulations

Fine Chemicals and Drugs. Dollars and cents maximum prices at manufacturers', wholesalers', and retailers' levels have been set by the Office of Price Administration in Maximum Price Regulation 278 issued December 4, and effective December 10, for totaquina, a newly developed product of cinchona bark. This

will be used in fighting malaria in this country, thus freeing all available supplies of quinine for the armed forces.

The use of totaquina, with attendant encouragement for the growing and collecting of the cinchona bark in Latin America, will extend the existing and future supply of cinchona bark by employing cinchonidine, cinchonine, and quinidine for malaria in addition to quinine.

Maximum retail prices will enable consumers to obtain totaquina at about half the cost of quinine. A smaller dosage of quinine is required, however.

Since only a few sales of totaquina were made on an experimental basis in March 1942, and at the higher prices which always accompany sales of this type, a specific maximum price regulation was issued. After conferences with representatives of the industry and of interested government agencies, the maximum prices were established on a basis of 40 cents an ounce for sales of totaquina powder in bulk quantities. Specific maximum prices are set for the powder and for tablets and capsules at all levels, including retail.

Fluorspar. Fluorspar ores have been freed from price control by the Office of Price Administration in another action designed to facilitate the Government's program for expansion of the production of fluorspar, Amendment 42 to Supplementary Regulation 1 to the General Maximum Price Regulation, effective November 23, 1942. Ceiling prices previously were the highest charged during the month of March 1942.

The action follows closely on the issuance November 18 of Maximum Price Regulation 126, as amended, which increased metallurgical and acid grade fluorspar maximum prices to encourage broadening of production in present mines and mills and development of new facilities. According to OPA, if fluorspar price increases are to become fully effective as production stimulants, they must be received by the producers of fluorspar ores from which the metallurgical and acid grades of fluorspar are obtained.

Glycerol. A big saving to the taxpayer on glycerol has been effected by the Office of Price Administration through a voluntary agreement with the six leading manufacturers to reduce their price one cent a pound on all sales to the Government. The companies, which produce 95 per cent of the Nation's glycerol, are Armour Soap Works, Colgate-Palmolive-Peet Co., Harshaw Chemical Co., Lever Brothers Co., Procter & Gamble Co., and Swift & Co. The agreement was worked out in conferences between company representatives and OPA's Chemicals and Drugs Price Branch.

Glycerol prices were reduced substantially in October 1942, when the product was brought under Price Schedule 38. With the new reduction of one cent, the price on sales to the Government will be 17.5 cents a pound in tank cars for C. P. glycerol (98 per cent glycerol), 17.75 cents in carload lots of drums, and 18.25 cents in less than carload lots of drums. All other grades will run 17 cents, 17.25 cents and 17.75 cents.

Phosphorus. Sales of phosphorus by the Tennessee Valley Authority to the Chemical Warfare Service of the War Department have been exempted from price control by the Office of Price Administration. The action was taken in Amendment 13 to Revised Supplementary Regulation 4, effective December 5, on the ground that TVA will make all such sales at cost.

The new form of Order M-19 is a straight allocation order replacing the previous conservation and allocation order. Under the new order control over the all-chlorine products will be exercised by controlling original shipments of chlorine. The change from end-use restriction to complete allocation control is made necessary because restrictions on consumption were too rigid when chlorine was in easy supply and not tight enough when chlorine was scarce. Under allocation control instant adjustments can be made in distribution and use control as the supply situation changes.

Under the new order no person may deliver, accept delivery, or use chlorine except by specific authorization by WPB. Exempt from these restrictions are users of 2,000 pounds or less per month, and delivery and use of chlorine for water purification and sewage treatment, so long as inventories are not for more than 30 days' supply. Purchasers under this exception must file a certificate with their supplier. Under the amended order purchasers must place their orders with distributors by the 5th of each month, and with producers by the 10th of each month. Forms PD-190 and PD-191 (revised) are to be used in applying for authorization under the order.

National Research Council Reports on Metallic Compounds

RECOMMENDATIONS as to relative essentiality of medicinal compounds made of metallic salts have been made to the War Production Board by a special subcommittee of the Committee on Drugs and Medical Supplies of the National Research Council. This report, requested by WPB, is an effort to marshal scientific advice as to which of the metallic compounds are most vital to medicine and which should, if restriction becomes necessary, be continued in production.

The recommendation of this committee, according to F. J. Stock of the Drugs and Cosmetics Section of the WPB Chemicals Branch, is simply a recommendation and does not mean that official action will be taken. The committee hopes that in matters dealing with the science of medicine it can get the advice of the medical profession and druggists.

Metallic compounds listed in the report are divided into two groups. Group I consists of arsenic and bismuth compounds, listed according to essentiality as follows: essential to the civilian practice of medicine to the extent of being practically indispensable; not indispensable but highly desirable if available; not essential to civilian practice of medicine.

Group II consists of aluminum, antimony, copper, and magnesium metal and compounds.

Interior Department Inventions Assigned to Government

OWNERSHIP and control of any inventions developed by Interior Department employees on government time or with government equipment hereafter will be assigned to the Federal Government in the interests of national security.

The Secretary's order gives official recognition to a policy already adopted voluntarily by virtually all of the technical and scientific personnel of the department. For a number of years many Interior Department employees who have made inventions have voluntarily assigned their patents to the Government, and others have turned over their patents for the duration of the war to the Government and to the war industries.

Lime Advisory Committee Formed by WPB

THE WPB Division of Industry Advisory Committees has announced formation of the following new committee:

LIME INDUSTRY ADVISORY, Committee, J. H. Russell, government presiding officer. Reed C. Rye, Warner Co.; Ralph L. Dickey, Kelley Island Lime & Transport Co.; John H. Durvall, Heesac Valley Lime Co., Inc.; Eric Johnston, Washington Brick & Lime Co.; Warren Lewis, Longview-Baginew Lime Works; H. B. Mathews, Jr., Mississippi Lime Co.; Bernard L. McNulty, Marblehead Lime Co.; Amos B. Miner, National Cyprus Co.; W. W. Sprague, National Mortar & Supply Co.; and E. I. Williams, Riverton Lime Co.

Industrial Economy Division Reorganized

THE Industrial Economy Division of the Bureau of Foreign and Domestic Commerce has again been reorganized into industrial groups. C. C. Concannon heads the Chemicals Unit, T. W. Delahanty the Drugs and Pharmaceuticals Unit, and Charles E. Lund the Fats and Oils Unit.

Chemical Exposition in War

Needs of wartime chemical industry were emphasized by 136 exhibits for the 24,000 visitors to the second biennial National Chemical Exposition, sponsored by the Chicago Section of the American Chemical Society, at the Hotel Sherman, Chicago, November 24 to 29. Concurrent with the exposition were well-attended meetings of the National Industrial Chemical Conference (four sessions), the newly formed National Conference of Electron Microscopy (two sessions), and the Chicago Section of the A. C. S. A program of industrial motion pictures of chemical interest continued throughout the Show.

Both visitors and exhibitors freely expressed satisfaction with the exposition generally, the products shown, and the value of the contacts made, in helping to solve problems arising in the rush of war production. Misgivings felt by many when both the locale and the dates of the exposition were changed as a result of the occupation of the Hotel Stevens by the Army proved groundless. Visitors found the exhibits of manufacturers (described in detail in Chemical and Engineering News of November 10, pages 1397 to 1451) replete with interest and placing emphasis on current problems of production and procurement. Exhibitors found interest on the part of visitors extraordinarily high and reported both active inquiries and orders booked in satisfying volume. With the Thanksgiving holiday and a Sunday falling in the schedule of the exposition, in addition to difficulties of transportation, volume of attendance fell short of that of 1940's show. However, representative exhibitors expressed themselves as well pleased with results obtained.

A proximate analysis of exhibits on the basis of products shown places them roughly in these classes:

Plant Equipment	76
Raw materials and chemical products	23
Laboratory supplies	21
Miscellaneous	16
Total	136

Particularly noticeable among the exhibits was the absence of heavy equipment. Photographs and small-scale models served instead to present ideas to visitors. Exceptions were a few operating units of small size.

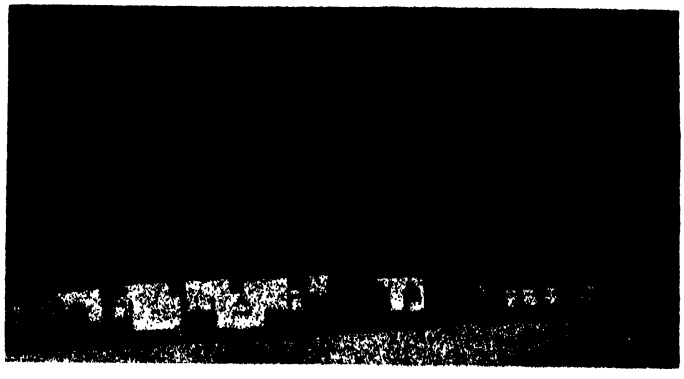
Ten special exhibits added importantly to the completeness of the show. The Alien Property Custodian featured the thousands of seized patents and applications now available for license to American industries. The American Chemical Society showed a number of "Alternates and Substitutes" important in our war economy (see below). Deficiency diseases and their control by proper nutrition were emphasized by the American Medical Association in a striking series of color photographs. The Chicago Ordnance District, War Department, provided a military atmosphere with a showing of ammunition, shells, miniature tanks, and other matériel. New chemicals for industry, shown by *Chemical Industries*, gave visitors a view of recent additions to the list. Safety in plant operation, particularly the problem of dusts, was emphasized by the Department of Labor, State of Illinois, with demonstrations of dust-counting and control methods. Results obtained with the electron microscope in the solution of industrial problems were shown in an extensive display of electron micrographs by leading workers in the field and the RCA Manufacturing Co. demonstrated its instrument for visitors. Handling of the nutritional problems of a huge army in the field has fostered important developments in preservation, dehydration, and packaging of foods, as demonstrated by the Subsistence Research Laboratory of the Chicago Quartermaster Depot by samples displayed of the various ration units now supplied to our armed forces. The War Production Board, with the assistance of manufacturers, showed methods, particularly applicable to chemical process industries, of economizing in the use of essential materials and of salvaging wastes.

Synthetic rubber was the subject of an important exhibit of special timely interest to which leading factors in our swiftly growing synthetic rubber industry contributed. Raw materials, processes, and finished products of the several types now in production (or shortly to be) were shown by diagrams, photographs, and samples, including tires.

Descriptions of individual exhibits have already appeared in these pages and need not be repeated here. Some of them suggest further comment, which is here presented as drawn from one man's notes:

Armour & Co. has amplified its list of fatty acid derivatives, amines, nitriles, and ketones of high molecular weight, in addition to its semisynthetic drying oils.

Atlas Powder Co. has added two new surface active agents to its growing list of products. They are called "Spans" and "Tweens".



Commercial Solvents Corp. proves its case for the versatility of nitroparaffins with more new products.

Corning Glass Works' Vycor high-silica glass was interesting in new forms.

Denver Equipment Co. showed the application of its flotation processes to removing husks from wheat grains to make high vitamin bread.

Eutectic Welding Alloys, Inc., made its booth an eye stopper by having a welder at work with special alloys and fluxes as applied at low temperature to a variety of metals.

Laboratory and semicommercial air classifiers were shown in operation by **Federal Classifier Systems, Inc.**

Troubles from water and steam were the subject of the "Chamber of Horrors" by **D. W. Haering & Co.**, who showed also the effectiveness of organic chrom-glucosates in preventing scale and corrosion.

The Flosdorf-Mudd Cryochem method of dehydrating sera from the frozen state was shown by **W. A. Hammond Drierite Co.**

Haveg Corp. included Saran tubing, piping, and fittings in its exhibit of plastic equipment.

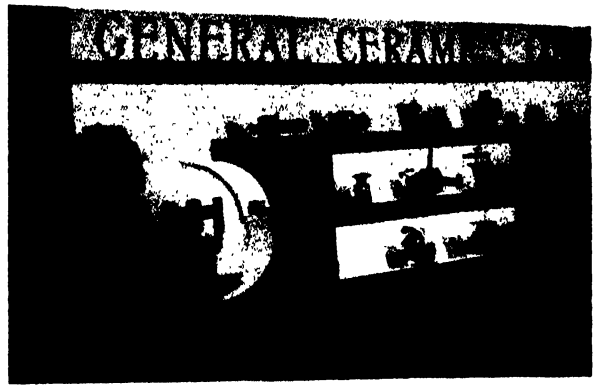
Low-temperature storage, down to −90° F., in a 5 cubic foot box was demonstrated by **Kold-Hold Manufacturing Co.**

The **Koppers Co.** featured the versatility of ammonium thiocyanate.

Lithgow Corp. emphasized its coatings for the protection of metals against corrosion: Lithcote (phenolaldehyde) and Cotoid (copolymer vinyl resin).

Ludlow Saylor Wire Co. made an attractive display of wire screens of a wide variety of metals and covering the range from coarse screens of 1-inch rods down to 325-mesh.

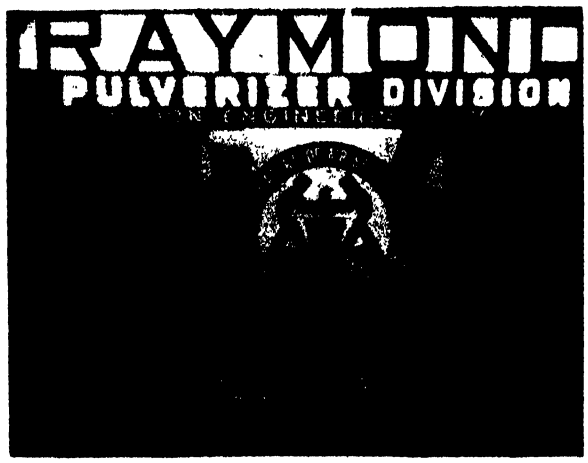
Marathon Paper Mills Co. demonstrated the usefulness of lignin resins, particularly in impregnated paper and laminated products.



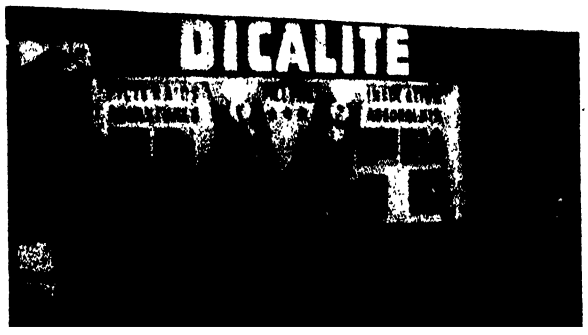
Merck & Co. emphasized synthetic vitamins and showed huge micrographs of crystals of these vital compounds. Also shown were sulfonamide drugs.

Dehydration of foods, important in its newest modifications in feeding our armies, was illustrated by **Proctor and Schwartz, Inc.**, with samples of the products of their dryers.

Ross & Rowe, Inc., showed new developments in the applications of lecithin both as a surface active agent and as an antioxidant.



Zirconium and titanium oxides are finding new and vital applications replacing critically scarce materials in ceramic and electrical fields, as demonstrated by the **Titanium Alloy Manufacturing Co.**



Union Bag & Paper Co. showed new developments in paper bags (multi wall and high wet strength) which enable them to serve a wider field of applications under present critical conditions.

Wilson Chemical Feeders, Inc., demonstrated its "Pulsafeeder" for handling liquid materials without contact with any of the working parts of the unit.

Particular interest under present shortages of new equipment attached to booths of three dealers in used equipment for chemical process use: **Consolidated Products Co., First Machinery Corp.**, and **Loeb Equipment Supply Co.**

A. C. S. Exhibit

"Alternates and Substitutes" was the title under which the AMERICAN CHEMICAL SOCIETY showed a number of products of special importance under present conditions. Obviously many of the items shown, adopted now of necessity, will occupy permanent places in our economy even after the emergency ceases to exist.

Replacement for Critical Metals. Resin-impregnated paper (automobile license plate).

Vulprene, rubber synthetics.

Arlac, shellac alternate.

Courtesy, AMERICAN RESINOUS CHEM. CORP.

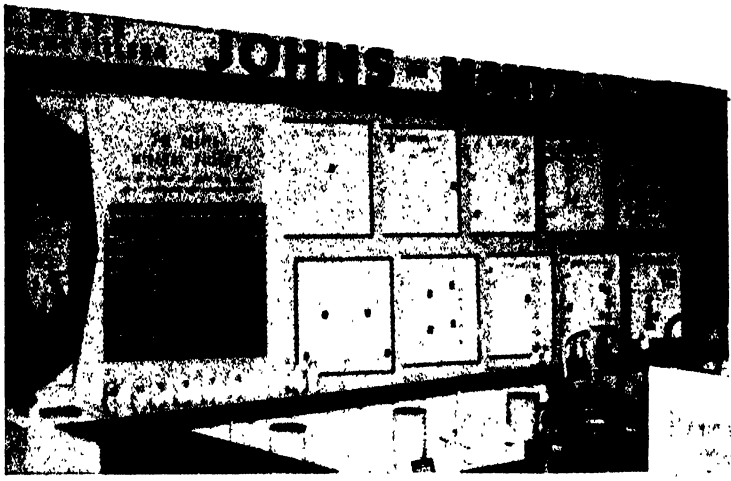
Official Buttons. Official buttons for Army, Marine Corps, and WAAC uniforms made of Beetle resin are shown.

Courtesy, AMERICAN CYANAMID CO.

Three Stages in Development of Substitute Paint Can. First stage is the usual metal can. Next comes a paper can with bonderized metal ends, saving 65 per cent of the metal. Final stage is a can completely made of impregnated fiber and containing no metal.

Tin-Saving Cans. Hot-dipped tin plate, Pb-Sn solder, 4.07 pounds of tin per 1,000 cans.

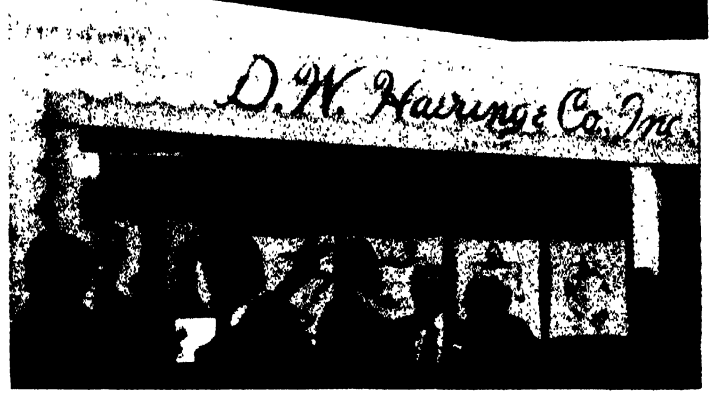
Electrolytic tin plate, Pb-Ag solder, 1.27 pounds of tin per 1,000 cans.



Ends of bonderized plate, bodies of electrolytic plate, Pb-Ag solder, 0.8 pound of tin per 1,000 cans.

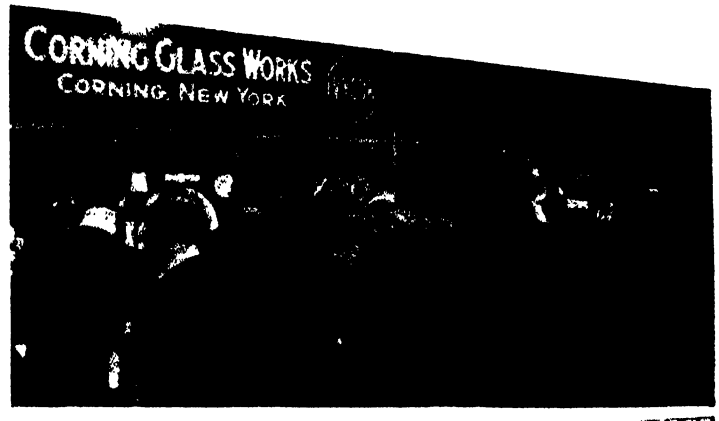
Courtesy, AMERICAN CAN CO.

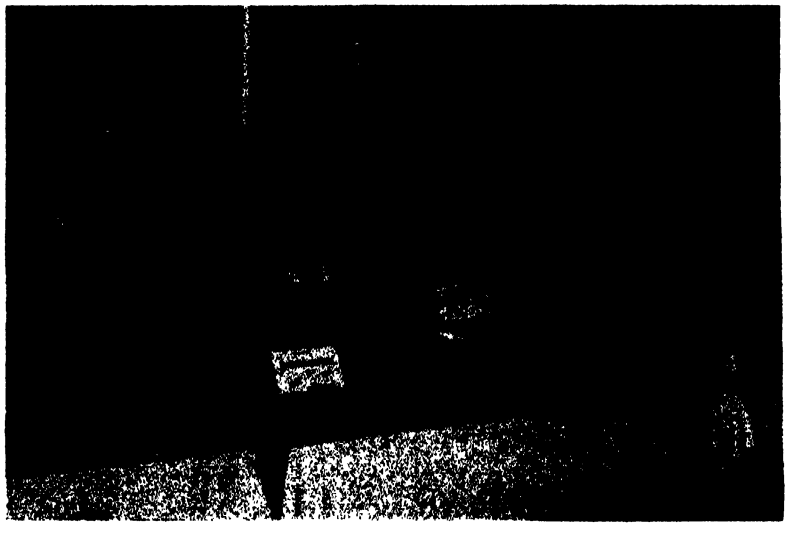
Manganese Bronze. Metallic arc-welded with 0.375-inch Ampco-Trode 10 Electrode. Preheat from 250° to 400°F., welded at 400 to 450 amperes.



Courtesy, AMPCO METAL, INC.

Neo-Fats. Neo-Fat No. 190 (synthetic drying oil) is a raw material suitable for the production of paints, varnishes, enamels, driers, spar varnishes, baking enamels, roof cements, putty,

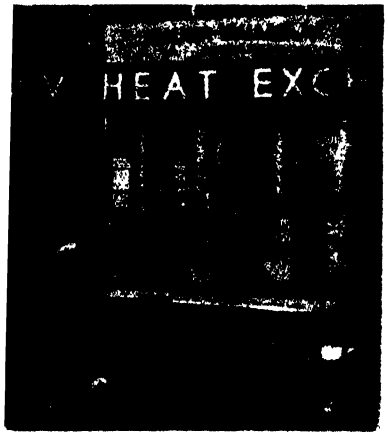




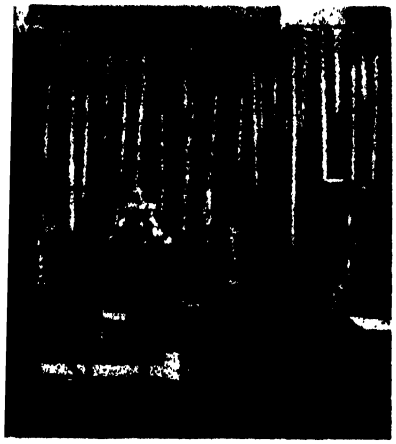
FILTER PAPER CO.

D. W. Haering & Co. Inc.

COMMINUTING EQUIPMENT



CORNING GLASS WORKS
CORNING, NEW YORK



ACID PROOF TANTALUM

waterproof paints, linoleum, oilcloth, lacquers, printing and lithographic inks, patent and enameled leathers, core oils, furniture polish, plastic composition, artificial rubber, curing leather, chamois tanning, lubricating compositions, rustproof coatings, tempering steel, insecticides (tree-banding compounds), etc.

Neo-Fat No. 170 (synthetic drying oil) is an unusual drying oil and may be used to advantage in formulating paints, enamels, printing inks, putty, core oils, and allied products where darker colors are permissible.

Neo-Fat No. 290 (bodied synthetic drying oil) is a polymerized oil of the stand oil type. The thermal treatment employed in producing this oil results in a bodied oil of light color with a very low acid value. It is a valuable raw material for the production of transparent lithographic varnishes, high-quality enamels, mill whites, paints, spar varnishes, printing inks, etc.

Courtesy, Armour & Co.

Spans (technical long-chain fatty acid partial esters of hexitol anhydrides) and **Tweens** (technical polyoxyalkylene derivatives of hexitol anhydride esters) are emulsifiers, detergents, and wetting agents, which possess wide solubility range, and are nonvolatile and virtually neutral.

Courtesy, Atlas Powder Co.

Be Square Special Waxes. Microcrystalline petroleum waxes of high melting point (160/165 and 180/185) having unusual properties.

Courtesy, Bareco Oil Co.

New Waring Blendors. The scarcity of essential metals necessitated a complete redesign of the Waring Blendor. The change resulted in many improvements in performance, appearance, and service. The case, now made of plastics instead of metal, provides better cooling and insulation properties, not to mention attractiveness. Further desirable features include dynamic balancing and rubber mounting to reduce vibration to a minimum, a "fan-governor" to regulate automatically the constancy of speed for perfect blending, and a high-powered motor with self-aligning, lifetime lubricated bearings for operation on both alternating and direct current.

Cellophane Replacing Metal. Cellophane, thin, light, but tough cellulose film, provides a moistureproof, vaporproof, germproof, greaseproof, and dustproof and medical products formerly packaged in tin cans or metal foil. It is thus releasing large quantities of metal for vital war uses. Cellophane-wrapped packages are also lighter, and in many cases less bulky, than the same quantities in metal, with a resultant important saving of shipping weight and space.

Recent applications of cellophane are illustrated by quick-frozen baked beans and vegetable shortening in cellophane-lined paper cans; dried eggs in cellophane-wrapped cakes and cellophane-lined cartons; aspirin tablets cellophane-wrapped in paper cover, match book style; first aid dressings and sulfanilamide in packages wrapped in moisture-resistant cellophane; U. S. Army Emergency Field Rations, with individual items cellophane-wrapped and the complete units enclosed in cellophane-laminated parchment cartons.

Rayon Tow for Mechanical Packing. Rayon tow made by the viscose process was introduced to the mechanical packing trade late in 1940. Unlike tow made from vegetable fibers, such as imported long-line flax, the filaments of rayon tow are continuous and the tow is made up of several thousand parallel fibers.

Mechanical Packing Braided from Rayon Tow. This sample of "dry" or nonlubricated packing was braided by Reliance Packing Co., Philadelphia, Penna., from du Pont rayon tow, Type 126. For a few specialized uses pumps are packed with the tow without impregnation. However, in the majority of cases the braided product is impregnated with fats, waxes, oils, etc.

Lubricated Mechanical Packing. This sample of rayon packing is ready for installation in stuffing boxes on equipment such as centrifugal and reciprocating pumps. Rayon packing has shown extremely low abrasion to the moving shaft or rod. The sample exhibited was braided and lubricated by Reliance Packing Co., Philadelphia, Penna.

Courtesy, E. I. du Pont de Nemours & Co., Inc.

Tapered Nylon Bristles. Tapered nylon bristles, recently announced, will serve as an alternate for scarce hog bristle in paint brushes. This development came at an opportune time, since the supply of natural bristles, imported chiefly from the Far East, is now largely cut off. The entire output of tapered nylon bristles is now being used for military purposes.

Nylon Paint Brush. Tapered nylon bristles in this paint brush wear at least three times as long as hog bristles. The first satisfactory alternate for hog bristle, nylon has not only the taper required for paint brushes, but also the resiliency, toughness, length, and inertness to paint ingredients.

Courtesy, E. I. du Pont de Nemours & Co., Inc.

"Bubblfil". These strands of transparent air-filled cellulose bubbles are produced as a replacement for imported kapok in life jackets, life rafts, air compartments of life boats, etc. It is fully as buoyant as kapok and its resilience makes it a possible alternate for sponge rubber. The bubbles cannot be broken by squeezing and the material will not ignite when struck by tracer bullets. Obviously, gases other than air could be used to fill the bubbles.

Courtesy, E. I. du Pont de Nemours & Co., Inc.

Ceraphragms. The new procelain-type electrolytic diaphragm has uniform porosity, low electrical resistance and permeability.

Courtesy, GENERAL CERAMICS CO.

Acrawax. Acrawax blends with carnauba wax, rosin, shellac, stearic acid, ester gum. It is not compatible with paraffins and other mineral waxes.

Acrawax B has excellent luster and is very similar in properties to Acrawax. It is compatible with paraffin wax and forms gels with mineral spirits and kerosene.

Acrawax C blends with paraffin wax, carnauba wax, rosin, etc. It is of particular interest where a high melting wax which is not brittle is desired. Because of its high flash point, Acrawax C can be used where ordinary waxes are unsuitable because of fire hazards.

Courtesy, GLYCO PRODUCTS CO., INC.

Nipocer blends with japan wax, paraffin wax, beeswax, carnauba wax, rosin, etc., and replaces japan wax in many cases. It emulsifies readily with the usual emulsifying agents, giving stable, smooth emulsions.

Courtesy, GLYCO PRODUCTS CO., INC.

Rezo Wax B replaces montan wax for certain purposes.

Courtesy, GLYCO PRODUCTS CO., INC.

Organic Chrom-Glucosates. Metal piping for water or steam can be protected from scale and corrosion by treating water with organic chrom glucosates, which possess effectiveness manyfold greater than corresponding inorganic chemicals. Thus critical metal in piping systems is saved with the use of minimal quantities of treating materials.

Courtesy, D. W. HAERING & CO., INC.

Cellulose Acetate Extruded Tubing. Collapsible plastic tubes (of properly formulated cellulose acetate plastics based on Hercules cellulose acetate flake) have proved tougher and more resilient than tin-base alloys. Because the sides do not cling together the contents are more completely usable.

These tubes are currently being supplied to at least two large toilet-goods companies by the makers, Celluplastic Corp., Newark, N. J.

Courtesy, HERCULES POWDER CO.

Dresinates act as emulsifiers, foaming agents, wetting and penetrating agents, detergent assistants. Available in varied combinations of properties to meet specific uses. Uses: ore flotation, powdered soaps, metal cleaning compounds, heavy-duty laundry cleaners, soluble oils, disinfectants, scrub soaps, etc.

Courtesy, HERCULES POWDER CO.

Ethyl Cellulose Plastics. A structural material featuring rapid, low-cost formation of complicated shapes; toughness at subzero temperatures; unusual stability under heat and high humidity; inbuilt color; light weight; dielectric properties; low specific heat. Uses: steering wheels, control knobs, airplane accessories, tubing, and uses where shock resistance is important as in flashlight cases.

Extruded ethyl cellulose plastics, easily applied by extrusion with high dielectric strength, toughness at low temperatures, and stability on exposure to heat and high humidity, soft formulations of ethyl cellulose can assume many of the insulation functions normally performed by rubber. Uses: signal wire, shielded cable, assault wire, aircraft, or other engine ignition cables, etc.

Soft ethyl cellulose plastics, possessing most of the qualities of rubber, with the major exception of immediate recovery after stress, these materials are being employed where the sealing, flexibility, or film-forming properties of rubber are desirable. Uses: grommets, gaskets, jar seals, etc. Coated cloth for stratosphere suits, waders, etc.

Courtesy, HERCULES POWDER CO.

Hercolyn (Hercules hydrogenated ester of rosin) acts as plasticizer compatible with nitrocellulose and resins used, also as gloss- and depth-producing resin to improve visual qualities of coatings. Used as alternate for, or to extend, scarce plasticizers of all types. Uses: in almost all types of formulation where nitrocellulose is used, such as lacquers, artificial leather, solvent-type adhesives, etc. More particularly for interior use.

Courtesy, HERCULES POWDER CO.

Laminated Paper Pipe. This pipe, molded by the Federal Electric Co. from a special patented paper supplied by the Flintkote Co., is reported on a weight-for-weight basis to equal steel in its major physical properties. The paper contains Hercules Vinsol resin, a low-cost thermoplastic, which bonds both the fibers in the sheets and the plies in the laminations into a hard, rigid, water-resistant structure. Uses: seismograph exploration, other uses where temporary low-pressure piping is needed, electrical conduit.

Courtesy, HERCULES POWDER CO.

Staybelite Resin (Hercules hydrogenated rosin) replaces stearic acid in rubber compounding (in part depending on formulation). Promotes tackiness and plasticity. Uses: carcass stocks and tread stocks, as replacement for stearic acid. Also used in camelback for recapping, in frictioning stocks for mechanical goods, in proofing stocks for fabric coverings, heels, and soles, in rubber cements, and in reclaiming process as a softener and tackifier in the pan process.

Courtesy, HERCULES POWDER CO.

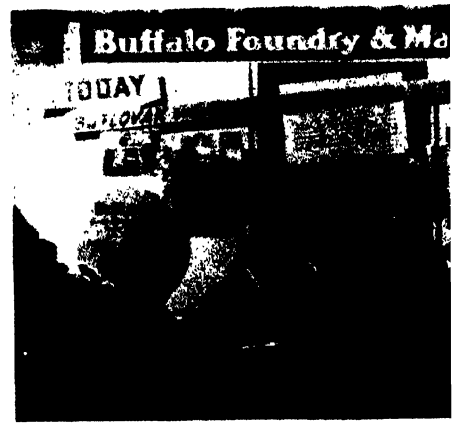
Thanite and D. H. S. Activator. Thanite is a complete replacement for pyrethrum as the toxic ingredient in sprays. D. H. S. activator is an extender for pyrethrum-base sprays which are already manufactured, which can be used to stretch pyrethrum content 50 to 100 per cent without loss of activity. Uses: household sprays for flies, mosquitoes, ants, spiders, wasps, etc. Cattle and livestock sprays. Institutional sprays.

Courtesy, HERCULES POWDER CO.

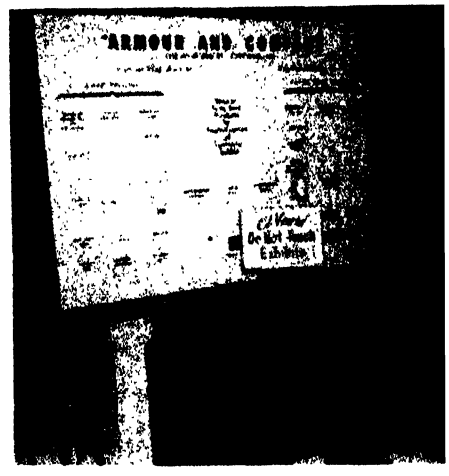
Saflex Army Raincoat. By making this army raincoat of Saflex resin, 1.75 pounds of rubber are saved and the weight of the coat is reduced by 2 pounds. Processing of the fabric is done on standard rubber industry machinery.

Courtesy, HODGMAN RUBBER CO. AND MONSANTO CHEMICAL CO.

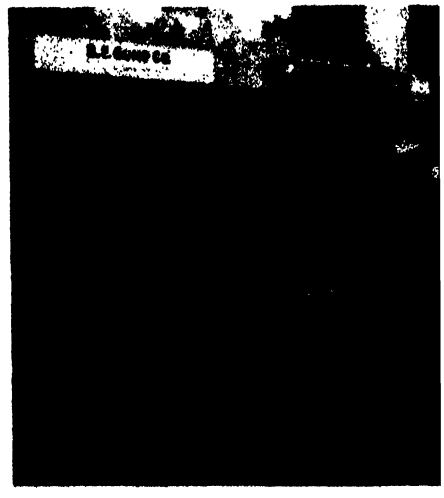
Celite Analytical Filter Aid, highly refined diatomaceous silica filter aid, specially prepared for laboratory filtration and analytical work. Used extensively to replace Gooch crucible fiber for many analytical procedures.



Courtesy, JOHNS-MANVILLE, INC.

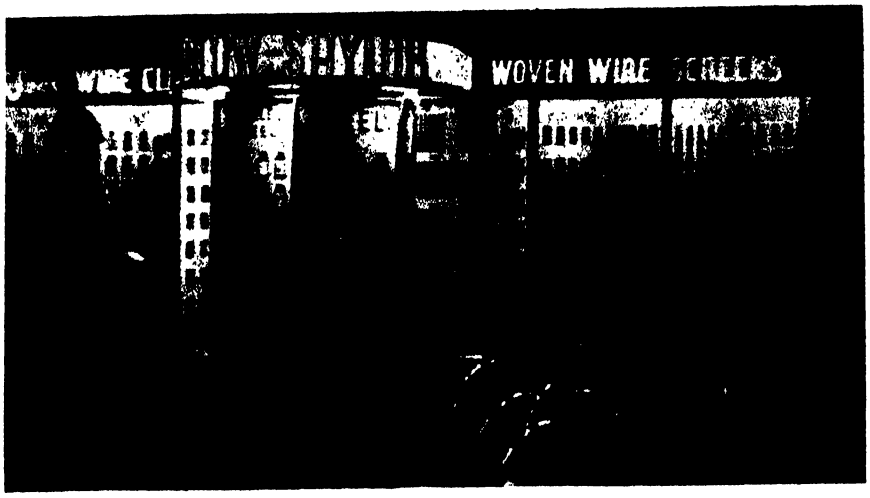


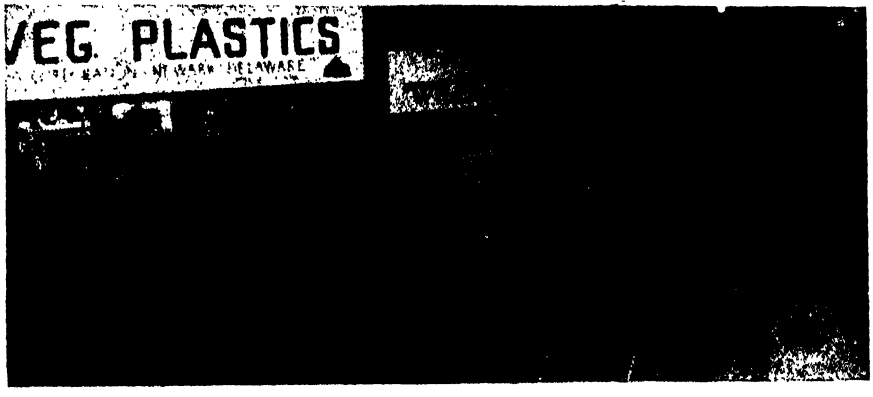
Celite 349, diatomaceous silica inert extender pigment specially prepared for low gloss finishes, particularly war camouflage paints.



Courtesy, JOHNS-MANVILLE, INC.

Celite 340, new type of extender filler and pigment for paper industry. Among





advantage are superior brightness and opacity, permitting reduction in use of prime white pigments.

Courtesy, JOHNS-MANVILLE, INC.

Zeo-Karb, carbonaceous cation exchanger, useful for recovering valuable cations or removing undesirable cations from solutions. One application is the recovery of copper and other metals from dilute solutions, such as brass pickling waste liquors. This method is especially valuable for solutions too dilute for economical handling by other methods.

Courtesy, THE PERMUTIT CO.

De-Acidite, anion exchange resin, useful for recovering valuable acids or anions, or removing undesirable acids or anions from solutions. One application is the salvage of platinum and other precious metals from plating or refinery wastes. The metal is adsorbed in the form of its complex anions, may be recovered by chemical regeneration or ashing of the saturated resin.

Courtesy, THE PERMUTIT CO.

Pfaudler Glass-Lined Pipe and Fittings, resistant to all acids, except hydrofluoric at elevated temperatures and pressures. Made in 2-inch diameter (and over) and in 10-foot length maximum. Jacketed pipe also available.

Zirconium Opacified Glazes. Zircon-amel and zirconium oxide for hollow and flatware.

Courtesy, TITANIUM ALLOY MFG. CO.

Tygon, synthetic rubberlike material. Tygon possesses an almost universal resistance to corrosion. Flexible in application, it retains its corrosion-resistance through a wide range of physical forms. Tygon is made in flexible sheets for tank linings, gasketing, etc.; in flexible or rigid tubing and rods; in liquid form for use as a corrosion-resistant paint or for impregnation of fabrics; and in formulations for extrud ng or molding.

Courtesy, U. S. STONEWARE CO.

Ceramic Chemical Equipment. Chemical stoneware tanks, piping, valves, towers, pumps, etc., have been used throughout the chemical and process industries for many generations. Its almost universal acid and corrosion resistance and its ready availability have made chemical stoneware equipment exceedingly popular during recent months for new chemical plant construction.

Courtesy, U. S. STONEWARE CO.

Resilon, resinous thermoplastic. This new improved Resilon material can serve as an alternate for highly critical rubber and synthetics for many applications. While limited in its range of usefulness, its low cost and ready availability prompt its use for pickle tank linings, sumps, HCl storage tansk, acidproof membranes, etc., where it will perform excellently if not taxed beyond its physical limitations.

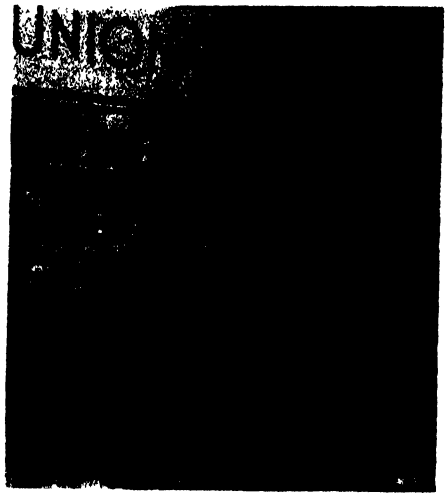
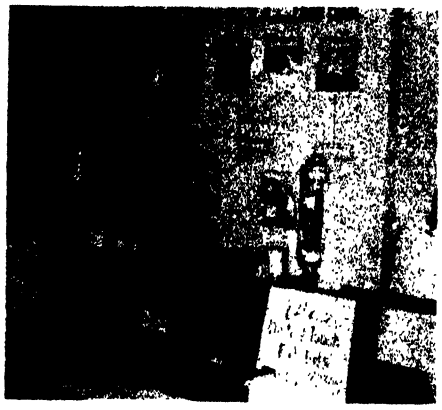
Conference Topics

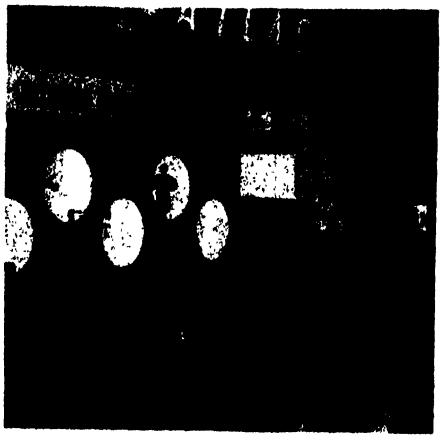
Meetings of the National Industrial Chemical Conference consisted of four independent sessions and a joint meeting with the Chicago Section, A. C. S.



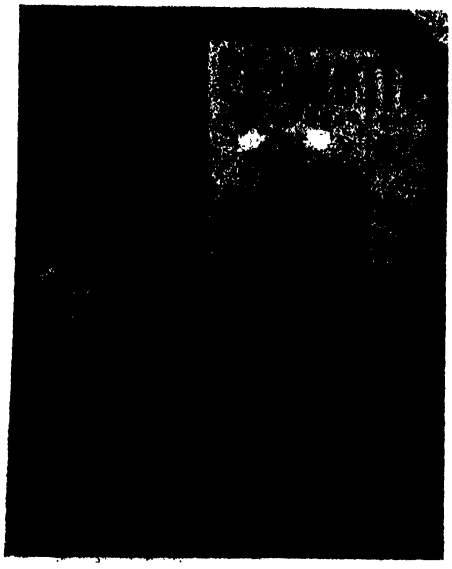
"Plastics and Paper" was the topic of Wednesday afternoon's meeting under the chairmanship of Norman A. Shepard, American Cyanamid Co. to Arthur E. Petersen, of the War Production Board, discussed factors controlling raw materials for plastic manufacture, pointing out the stringencies existing in many of these on account of military needs for them. "Paper and Paper Materials" were reviewed by Allen Abrams, of Marathon Paper Mills Co., with special emphasis on recent improvements and adaptations of pulp and paper to replace critical materials.



The Electron Microscope was discussed by V. K. Zworykin, of R.C.A. Manufacturing Co., at the joint meeting with the Chicago Section on Thursday evening. Dr. Zworykin described the development of the electron microscope and its applications and told of the latest developments: a simplified portable or table model, adaptation of the present instrument to make electron diffraction patterns and stereoscopic micrographs, and the use of extremely high voltages in securing greater penetration of specimens. R. C. Newton, of Swift & Co., chairman of the Chicago Section, presided.



Food was the topic of Friday afternoon's session under the chairmanship of C. G. King, of the Nutrition Foundation. Soil, fertility, and nutrition were emphasized in relation to the food problem in three papers by L. A. Maynard, Cornell University, by W. A. Albrecht, College of Agriculture, Columbia, Mo., and by Dr. King.



P. Gerald Kruger, University of Illinois, discussed "The Cyclotron and Its Uses in Research" at Friday evening's session, under the chairmanship of Victor Conquest, of Armour & Co.

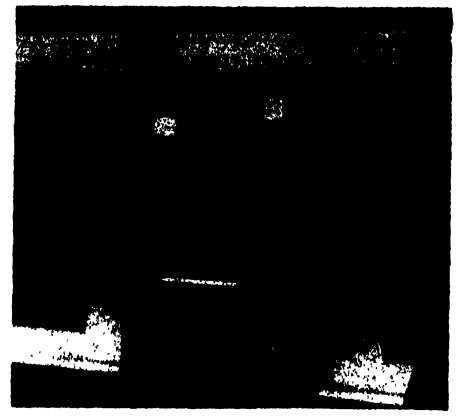
"Industrial War Problems" were considered at Saturday afternoon's session under the chairmanship of Carl S. Miner, of Miner Laboratories. Ward V. Evans, of Northwestern University, described methods of controlling incendiaries. The treatment of wastes in a war economy

was the topic of F. W. Mohlman, of the Sanitary District of Chicago; and S. Donald Perlman, of the War Production Board, urged salvage and conservation in the chemical industry, pointing out examples of savings of valuable materials that can be effected.

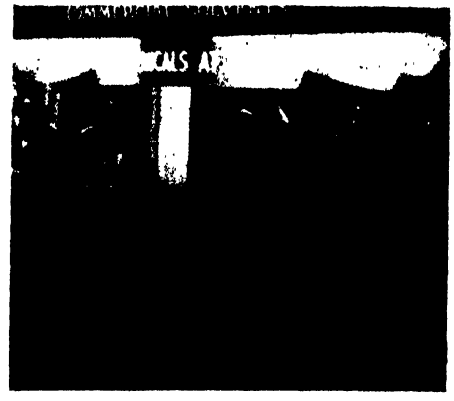
Exposition Committee

Victor Conquest, of Armour & Co., was chairman of the Chicago Section's committee responsible for the exposition. Other members of the committee were. Arthur Guillaudeu, Swift & Co.; W. M. Hinman, Frederick Post Co.; W. C. Johnson, University of Chicago; L. E. May, Sherwin-Williams Co.; and H. E. Robinson, Swift & Co. Many members of the Chicago Section served on subcommittees handling various phases of the exposition. Marcus W. Hinson was exposition manager for the Section.

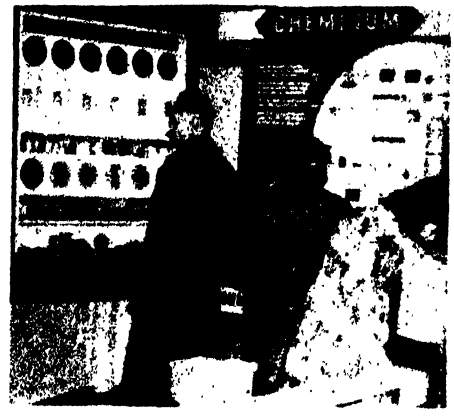
Food for Amazon Rubber Tappers



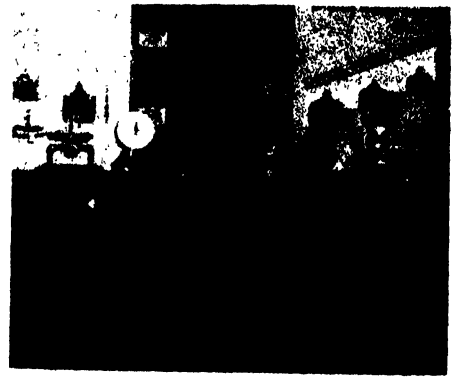
BRAZIL and the United States are working on a complicated food problem—the feeding of rubber tappers and their families in the Amazon Basin. This basin, with its millions of wild rubber trees, is considered the best potential source for quick expansion in natural rubber production, and its population is expected to double by the end of 1943, rising to perhaps 500,000 tappers, rubber handlers, and their families.



Brazilian and United States authorities agreed recently to contribute to a $4,000,000 fund for improvement of food production in Northern Brazil. Plans look to food raising in the interior, for as northern Brazil is almost without rail communications the shipping shortage makes it difficult to import needed supplies.



A 228-mile railway, built at the height of the Amazon rubber boom 30 years ago, but completed too late to serve this purpose may be useful now. This is the Madeira-Mamore Railway, 2,000 miles up the Amazon River, which by-passes the rapids and cataracts of the Madeira and Mamore Rivers, near Porto Velho.



Petroleum Industry Not a Competitor of Agriculture

THE petroleum industry is far more interested in regaining its market for gasoline and motor oil than in competing with agriculture for the post-war synthetic rubber market, Gustav Egloff, director of research of the Universal Oil Products Co., told members of the National Farm Chemurgic Council at its recent conference in Cincinnati. The 1941 consumption of gasoline was 28,000,000 gallons; compared with this, the amount of petroleum used by synthetic rubber manufacturers would be relatively small.

The Economic Status of the Members of the American Chemical Society *(Continued[1])*

Approved Report of the Committee on Economic Status

George Calingaert, Walter A. Schmidt, Walter G. Whitman, Frank C. Whitmore, L. W. Bass[2], Chairman

Prepared for the Committee by Andrew Fraser, Jr., Washington, D. C.

Characteristics of the Special Analyses of Monthly Salary Rates of the Membership

EXCEPT for Section 3, the findings of the several preceding analyses have been derived from the information furnished by the membership as a whole. In the ensuing sections it is important to note that, in all but Section 9, the data analyzed are those reported by male regular members of the SOCIETY only. In all instances, however, the relationships established are concerned only with the median monthly salary rates of the several groups of members. Furthermore, in keeping with the similar analyses of monthly salary rates for the membership as a whole these median earnings were computed only if 10 or more members reported.

A general measure of the densities of the several samples on which the ensuing analyses are based can be obtained by contrasting the numbers of usable returns utilized in these special analyses with those reported by male regular members shown in Table 3. That table shows that 16,104 male regular members furnished usable information. Of this number 15,653 or 97 per cent furnished data on their monthly salary rates. In the field of chemistry 11,536 male regular members responded with usable information, but no less than 11,167 or 97 per cent furnished information that was used in the special analyses of their monthly salary rates. Among the five educational levels in the major field of chemistry, proportions used ranged from 66, or 89 per cent of the gross returns of the 14 who reported they had had no college training, to as high as 5,596, or 97 per cent who reported they had obtained doctors' degrees in chemistry. In each of the three other fields of chemical engineering, other field of science or engineering, and any other field the proportions of returns used were exactly similar to those noted above for the field of chemistry.

Not all of these special analyses of monthly salary rates are shown according to years of professional experience. For such as are shown on this basis only the year 1941 has been chosen for purposes of analysis. Of these, those presented for selected occupational statuses, sources of employment, and fields of specialization are distinctly unique in that they make available for the first time contrasts in earnings with advancing years of experience of an important group of professional members. All other special analyses are shown without regard to years of professional experience for the years 1929, 1934, and 1941. The deciding factors in choosing these particular years were: 1929 was a year of high level of earnings; earnings in 1934 were generally the lowest;

2 FEWER THAN 10 MEMBERS REPORTED

[1] CHEM. ENG. NEWS, 20, 1563 December 10, 1942).

[2] Communications regarding this report should be addressed to L. W. Bass, Director, New England Industrial Research Foundation, Statler Building Boston, Mass.

and 1941 was the most recent year for which information was requested in the survey.

Section 9. Monthly Salary Rates of Four Classes of Members

Since male regular members are the predominating class of the membership it is not surprising that at all experience spans their reported monthly salary rates in 1941 generally exceeded those reported by the membership as a whole (Table 27 and Chart 6). With advancing years of professional experience median earnings for the membership as a whole in 1941 steadily advanced from $140 a month for those just beginning their professional careers and reached a maximum of $445 a month at from 37 to 41 years after entering the profession. Within these same limits of experience, however, median earnings of male regular members advanced from $160 to $451 a month. Between all reporting members and all reporting male regular members the sharpest differences in median monthly salary rates occurred at the experience spans of one half year, and one year. At these respective points the differentials in earnings in favor of the latter were $20 and $39 a month. At all succeeding experience spans the differentials continued to favor the male regular members and ranged from $2.00 to $7.00 a month.

Between male regular and female regular members there were, however, significant differences in median monthly earnings in 1941 which were also in favor of the former class. Furthermore, the earnings capacity of female regular members reached maximum 5 years earlier, at from 32 to 36, years than that of from 37 to 41 years previously noted to be the case for male regular members. At their maximum point of earnings, median monthly salary rates reported by female regular members were $330, or $117 a month less than the median earnings of $447 a month reported by male regular members with corresponding years of experience. For the experience spans of from 22 to 36 and of from 27 to 31 years the corresponding earnings differentials, still in favor of male regular members were, respectively, $140 and $153 a month. At all six earlier experience spans among which comparisons of earnings could be made, similar favorable differentials existed. These ranged from $33 a month at from 14 to 17 years' experience to $91 a month at from 10 to 13 years after the two classes of members had entered the profession.

The median monthly earnings of male junior members in 1941 even exceeded those of female regular members for the experience spans of 4 years after entering the profession to from 18 to 21 years after entering the profession by amounts that ranged from $26 to $55 a month. Between the reported earnings of male regular and male junior members there were also significant differences. In 1941 male junior members who had just begun their professional work were earning $140 a month, whereas male regular members were earning $20 a month more, or $160 a month. Four years later the median monthly earnings of these two classes of members, also in 1941, were, respectively, $174 and $194 a month; again a differential of $20 a month in favor of male regular members. At from 18 to 21 years after entering the profession the differential had increased to $97 a month. At this experience span male regular members reported median monthly earnings of $367 a month in contrast to $270 a month for male junior members.

The differentials that existed in 1941 between monthly earnings of male regular and male junior members are not surprising. They may merely reflect differences that exist in professional activities. This situation may account also for the marked differences in earnings noted between male regular and female regular members. The extent of these differences certainly does indicate, however, that a problem exists which warrants detailed consideration to determine whether or not an improvement could be effected in the economic status of the female regular members in terms of earnings capacity.

Section 10. Monthly Salary Rates of Male Regular Members in Three Major Fields

Despite the incompleteness of the data up to 3 years after entering the profession (Table 28), it is evident from the earnings curves shown in Chart 7 that for members with from 4 to 9 years' professional experience in 1941 the median monthly earnings of male regular members in the field of chemistry were only slightly greater and only slightly less than those of similar

CHART 7 - MONTHLY SALARY RATES IN 1941 OF MALE REGULAR MEMBERS REPORTING IN THREE MAJOR FIELDS ACCORDING TO YEAR OF ENTERING PROFESSION

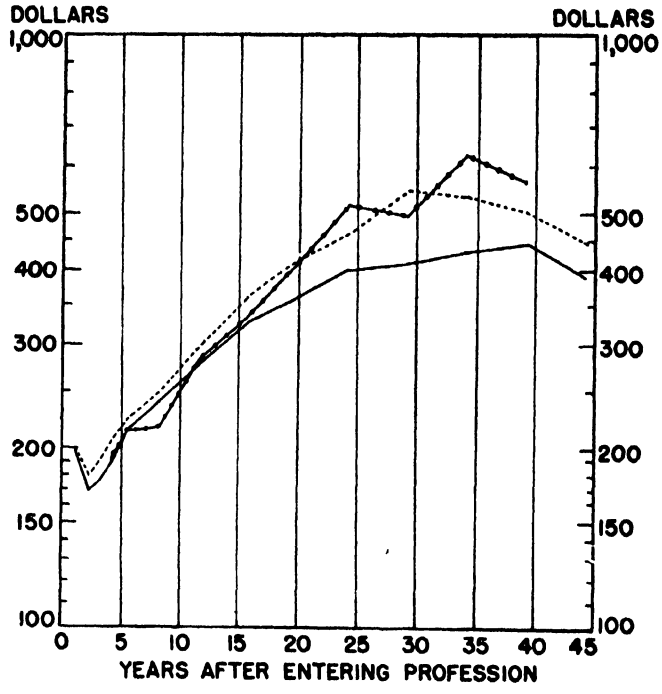

TABLE 28.—COMPARISON OF MEDIAN MONTHLY SALARY RATES IN 1941 OF ALL MALE REGULAR MEMBERS REPORTING IN THREE MAJOR FIELDS, BY YEAR OF ENTERING PROFESSION

YEAR OF ENTERING PROFESSION	19–	41	40	39	38	37	35 TO 36	32 TO 34	28 TO 31	24 TO 27	20 TO 23	15 TO 19	10 TO 14	05 TO 09	00 TO 04	(1)
YEARS AFTER ENTERING PROFESSION		1/2	1	2	3	4	5 TO 6	7 TO 9	10 TO 13	14 TO 17	18 TO 21	22 TO 26	27 TO 31	32 TO 36	37 TO 41	42+

OTHER FIELD OF SC. OR ENG.		(2)	(2)	(2)	(2)	190	212	216	278	326	406	510	488	620	558	(2)

1 PRIOR TO 1900
2 FEWER THAN 10 MEMBERS REPORTED

classes of members in other fields of science or engineering, and chemical engineering, respectively.

Over this 6-year period, reported median earnings of male regular members in the field of chemistry advanced with professional experience from $189 to $239 a month. Thereafter they still continued to advance and reached a maximum of $423 a month for members, who, in 1941, had had from 32 to 36 years' professional experience. At all points in the latter experience span, however, the earnings of members in the field of chemistry were lower than those reported by male regular members in the other two major fields.

While median monthly earnings of male regular members in the field of chemical engineering steadily increased over this same experience span in 1941 from $298 to $523 a month, the increase over the same period for male regular members in other fields of science or engineering was from $278 to $620 a month. Between these two fields, however, the general tendency was for earnings in chemical engineering to be lower beyond the 25 years' experience span.

Section 11. Monthly Salary Rates of Male Regular Members in Relation to Educational Level

In this section the only median monthly earnings data compared are those of male regular members who reported that they had bachelors', masters', and doctors' degrees in the two major fields of chemistry and chemical engineering (Table 29 and Chart 8). Discounting the few obvious discrepancies in reporting the year in which they obtained their doctors' degrees in chemistry rather than the year in which they had obtained their bachelors' degrees, these data clearly indicate that at virtually all experience spans in 1941 members with masters' degrees in chemistry earned less in that year than did those with bachelors' and doctors' degrees. Over the 1941 experience span of approximately 30 years, median earnings of male regular members with masters' degrees in chemistry steadily increased with years of professional experience from $163 a month to $373 a month. By contrast, over the same experience span, median earnings of similar groups of members with bachelors' and doctors' degrees in chemistry increased, respectively, from $163 to $409 a month, and from $253 to $418 a month.

Among these three educational levels the spread in median monthly earnings was clearly defined after 9 years of professional experience. Beyond this experience span and up to that of maximum earning capacity, median earnings of both bachelors and doctors in chemistry consistently exceeded those of masters in this field by approximately $35 a month.

The uniformity of this earnings differential results from the fact that, as can readily be seen from Chart 8, median monthly earnings of bachelors and doctors in chemistry were practically the same at all of the experience spans extending from 15 to 31 years after these male regular members had entered the profession.

In contrast to the preceding, among male regular members trained in the field of chemical engineering median monthly salary rates in 1941 paralleled the level of education reported. That is to say, bachelors' earnings generally were

TABLE 29.—COMPARISON OF MEDIAN MONTHLY SALARY RATES IN 1941 OF ALL MALE REGULAR MEMBERS REPORTING IN TWO MAJOR FIELDS, BY EDUCATIONAL LEVEL AND YEAR OF ENTERING PROFESSION

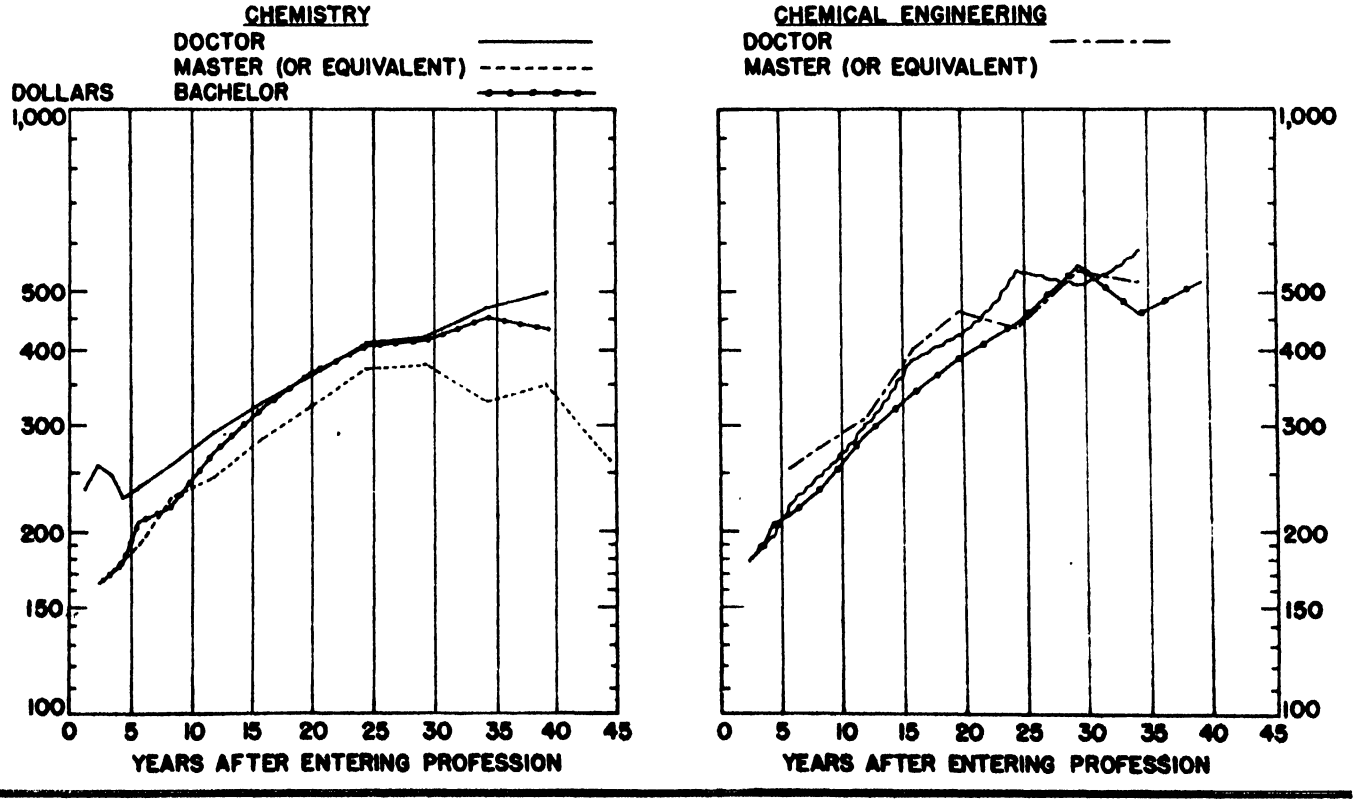
CHART 8 - MONTHLY SALARY RATES IN 1941 OF MALE REGULAR MEMBERS REPORTING IN TWO MAJOR FIELDS BY EDUCATIONAL LEVEL AND YEAR OF ENTERING PROFESSION



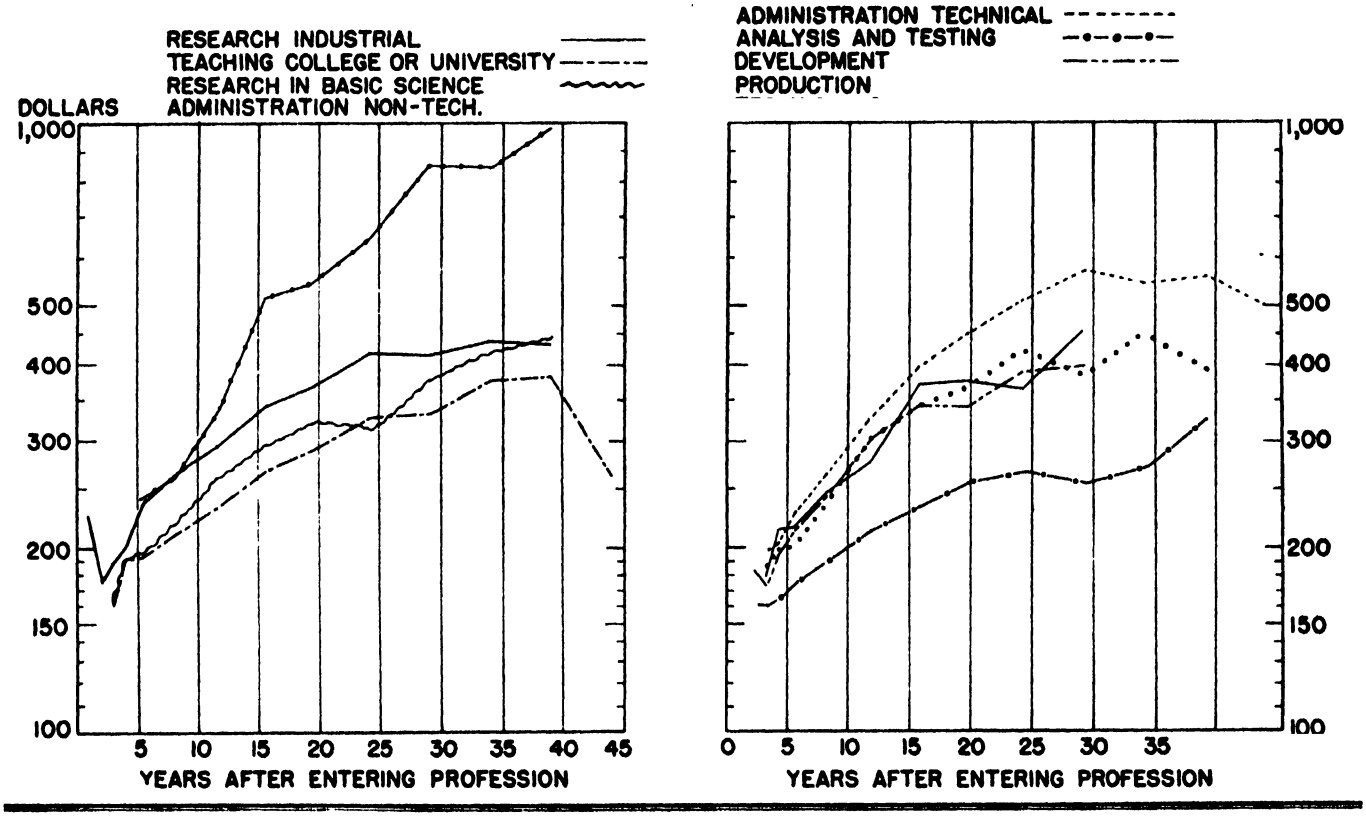


CHART 9-MONTHLY SALARY RATES IN 1941 OF MALE REGULAR MEMBERS REPORTING IN SELECTED OCCUPATIONAL STATUSES ACCORDING TO YEAR OF ENTERING PROFESSION

lower than masters' and these in turn generally were lower than doctors'. This situation existed up to the experience level of 20 years. Over this period median earnings of male regular members with bachelors' degrees in this field rose steadily from $179 to $388 a month, and those of masters rose from $178 to $423 a month. And beginning with male regular members with from 5 to 6 years' experience median earnings of doctors in chemical engineering increased steadily from $254 to reach $465 a month for those who had had 20 years' professional experience in 1941. The over-all range in earnings of approximately $35 among these three educational levels over this same period was the same as that previously noted for male regular members in the field of chemistry Beyond the 20 years' experience span the earnings reported by male regular members with bachelors' degrees in chemical engineering continued to advance steadily and reached a maximum of $551 a month for those who had had from 27 to 31 years' professional experience in 1941. In the case of male regular members classified in the other two educational levels, the break in the continuous advance in median monthly earnings reported was most probably the result of lack of data because after the 25 years' experience span doctors' earnings again began to increase and likewise for masters' after the 30 years' experience level. For these two educational levels the maximum median earnings actually reported for 1941 were, respectively, $545 and $583 a month.

1 PRIOR TO 1900
2 FEWER THAN 10 MEMBERS REPORTED

If, now, the earnings of male regular members in these two major fields be contrasted, the important fact that does emerge is that in 1941 the rate of increase in earnings at all three educational levels was relatively greater for members in the field of chemical engineering. This is evidenced by comparing the median earnings at selected experience levels of members with bachelors' degrees in either field. Thus after approximately 5, 10, 20, and 30 years' experience while bachelors in chemical engineering reported earnings of $216, $260, $388, and $551, respectively, a month for similar levels of experience the corresponding median earnings reported by male regular members in the field of chemistry were $200, $240, $360, and $409 a month.

Section 12. Median Monthly Salary Rates of Male Regular Members by Occupational Status

Although the questionnaire included 26 occupational statuses, sufficient data to warrant comparisons of the median monthly salary rates of male regular members on a year of entering profession basis are reported for only nine statuses (Table 30). As shown in Chart 9, the earnings reported in 1941 for these several occupational statuses maintained a fairly constant relationship with advancing years of professional experience. As is also evident from the chart, the highest salary rates for the nine occupational statuses were paid in nontechnical ad-

ministration, while the lowest rates were paid in analysis and testing. Over the experience levels ranging from 5 to 6 and from 27 to 31 years after entering the profession, earnings of male regular members in nontechnical administration advanced from $240 to $844 a month, while those of male regular members engaged in analysis and testing advanced from only $178 to $254 a month. The differentials in earnings during 1941 between these two occupational statuses, over the same experience levels, therefore ranged from $62 to $590 a month.

Among the remaining seven occupational statuses, on the other hand, the corresponding earnings differentials ranged from only $42 to $241 a month. The upper and lower limits of the spreads in earnings in this range covered those of male regular members engaged in technical administration, on the one hand, and college or university teaching on the other. From 5 to 31 years after entering the profession, earnings in technical administration advanced from $234 to $570 a month, whereas in college or university teaching they advanced from $192 to $329 a month.

Development work represented the middle level in earnings capacity among the remaining five occupational statuses. In 1941, male regular members with from 5 to 31 years' professional experience so reporting were able to earn from $216 to $400 a month. These median monthly earnings were only slightly less at each experience level than those reported by male regular members engaged in industrial research and technical service, and only slightly greater than those reported by similar groups of members engaged in production and in research in basic science.

Considered without regard to years of professional experience, comparisons can be made of median monthly earnings of male regular members among as many as 20, 20, and 23 occupational statuses, respectively, for the years 1929, 1934, and 1941 (Table 31). In each of these three years, the ranking order of the earnings remained fairly constant.

In 1941 the lowest level of median earnings of $183 a month was reported by male regular members engaged in nonprofessional work, while the highest level of $599 a month covered those engaged in nontechnical administration. The noted lowest level of earnings was only $22 a month less than the earnings of $205 a month reported for analysis and testing, and these in turn were practically the same as those reported for maintenance ($210 a month). It may be recalled here that, on a year of entering profession basis, analysis and testing occupied the lowest level of earnings in the nine selected occupational statuses previously discussed and technical administration was next in order to nontechnical administration. It is evident, however, from the data in Table 31 that the $404 a month earnings capacity of the technical administration status was less than that of $413 a month reported by male regular members classified as independent consultants. Earnings for technical administration in 1941 did, however, exceed those for male regular members engaged in patent work, reporting $385 a month. Between this group and sales, which was next in descending order of earnings in 1941, there was a $52 a month differential; and the median earnings of $333 a month for sales were greater by only $26 a month than the median earnings of male regular members engaged in editing and writing.

Among the 23 occupational statuses shown in Table 31 for the year 1941, the middle level of earnings of $260 a month covered development work. The statuses with earnings greater than this amount, but less than those of $307 a month previously noted for editing and writing, taken in descending order, were design, production, industrial research, technical service, and "other professional work". Among these five occupational statuses median monthly earnings of male regular members ranged from $264 to $289 a month. Immediately below development, on the other hand, the range in median earnings among seven of the occupational statuses was from $240 a month for safety engineering to $258 a month for college or university teaching. The intermediate earnings included in this range, taken in descending order of value, were those reported by male regular members in the occupational statuses of construction and installation, "teaching, other", research in basic science, secondary school teaching, and library and information service.

Despite the incomplete coverage of all statuses shown in Table 31, sufficient data were reported to provide a limited measure of the extent of the fluctuations in occupational status earnings over the period 1929 to 1941. From 1929 to 1934, median monthly earnings declined in every occupational status among which comparisons can be made. Relatively these declines ranged from as low as 6 per cent in the case of design, to as high as 46 per cent in the case of maintenance. Between 1934 and 1941, on the other hand, increases in earnings without exception were reported in relative amounts that ranged, again from 6 per cent in the case of design, to as high as 91 per cent in the case of maintenance. Covering the entire 12-year period, median monthly earnings reported by male regular members for 1941 were in a few instances higher than those reported for 1929. This situation, it should be emphasized, does not vitiate the general conclusion to the effect that earnings for the membership as a whole in 1941 had not returned to the earnings levels reported for 1926 or 1929. It merely reflects the effects of selective bias in favor of any analysis that would be made for any aspect of the data reported by male regular members only.

Section 13. Median Monthly Salary Rates of Male Regular Members by Source of Employment

According to the data presented in Table 32 and in Chart 10, the spread in earnings reported for 1941 by male regular members in the employ of the federal, municipal, and state governments averaged only $26 a month up to the experience level of approximately 15 years after entering the profession. The evidence is that, from 3 to 15 years after entering the profession, median earnings of male regular members engaged by state governments advanced from $145 to $263 a month, while earnings of male regular members employed by the Federal Government advanced from $181 to $290 a month. Midway between these extremes was found the earnings curve for male regular members in the employ of municipal governments.

Beyond the 15 years' experience span, earnings reported for these three sources of public employment continued to advance at approximately the same rates. At the experience level of from 27 to 31 years, members employed by the Federal Government reported they were earning $373 a month, as against $355 and $332, respectively, for members of similar experience level in the employ of municipal and state governments.

Among the four nonpublic sources of employment, the spread in earnings was considerably greater than that occurring among the three sources of public employ-

than those of the sources of non-public employment. A slight qualification is necessary, however, when consideration is given to the median monthly earnings computed without regard to years of professional experience (Table 33).

As is shown in Table 33, it is possible for the period 1929 to 1941 to make comparisons of earnings among 11 of the 14 sources of employment on which data were requested. Examination of the changes in earnings which occurred over the period 1929 to 1934 indicates that earnings of male regular members declined in all sources of employment

CHART 10-MONTHLY SALARY RATES IN 1941 OF MALE REGULAR MEMBERS REPORTING IN SELECTED SOURCES OF EMPLOYMENT ACCORDING TO YEAR OF ENTERING PROFESSION

ment. Moreover, male regular members employed by private firms reported median monthly earnings in 1941 very much greater than those of similar groups of members who reported they were attached to educational institutions.

For members in the latter source of employment with 4 years of professional experience, median earnings in 1941 were $170 a month, as against $198 for members with the same span of experience in the employ of private firms. After approximately 29 years of experience, however, male regular members employed by private firms were earning $482 a month, in contrast to only $328 a month for those in the employ of educational institutions. In other words, in 1941 there was a spread in monthly earnings that ranged from $28 to $154 between private firm employment and educational institution employment over a period that covered approximately two thirds of the whole experience span. On the other hand, the median monthly earnings reported over this same period by male regular members employed in research institutes and in consulting work did not differ materially from those of members employed in private firms.

Comparisons of earnings among these seven selected sources of employment indicate that in 1941, educational institutions excepted, the earnings capacities of the sources of public employment were lower except in the Federal Government. On the other hand, from 1934 to 1941, earnings from this source of employment increased by only 6 per cent, while all other sources over the same period increased from 16 to as high as 155 per cent.

Analyzing the 1941 data, it is seen that the median earnings of $323 a month for male regular members in the employ of technical or trade associations exceeded those of $304 a month for members employed by private firms, which in turn exceeded the earnings of $281 a month for those in research institutes. Between consulting ($269 a month) and Federal Government ($263 a month), respectively fourth and fifth in descending

order of earning capacity, the earnings differential was insignificant. Similarly, there was a small differential between the earnings of male regular members classified in "other nonpublic" pursuits ($260 a month), and those for members employed with municipal and state governments which ranged downward from $259 to $254 a month. Below that level, male regular members reporting employment in educational institutions and by "other public authorities" in 1941 were able to earn $247 and $240 a month, respectively. Significantly enough, the lowest median earnings of $220 a month were reported by male regular members in the employ of county governments.

Section 14. Median Monthly Salary Rates of Male Regular Members by Field of Specialization

Following the pattern of analysis developed in Sections 13 and 14, attention is first directed to the fact that earnings on a year of entering profession basis are reported by male regular members for as many as 22 of the 34 fields of specialization to which responses were requested (Table 34). When arranged in descending order of earnings for 1941, inorganic chemical technology was found consistently to be the field of specialization with the highest earnings capacity, while general chemistry (basic science) was just as consistently the field of lowest earnings capacity.

From these two fields of specialization it is possible to derive a general measure of the over-all spread in earnings which prevailed with advancing years of professional experience in 1941. Thus, at the level of approximately 5 years after entering the profession, while median earnings reported for inorganic chemical technology were $224 a month, those reported for general chemistry were only $178 a month. After 34 years of experience, however, members in the former field of specialization were able to earn as much as $545 a month as compared to only $327 a month for members reporting in the latter field. It is readily seen, therefore, that in 1941 the general spread in median monthly earnings of male regular members reporting ranged from $46 to $218 for the experience levels from 5 to 34 years.

To facilitate discussion, the earnings in these 22 fields of specialization have been separated somewhat arbitrarily into four groups. The earnings curves for these groups are presented in Chart 11.

In the first group, a clear line of demarcation is apparent between the earnings capacities of male regular members engaged in either inorganic technology or industrial chemistry, and earnings capacities of similar groups of members in the three basic science fields of physical, organic, and general chemistry. In 1941, for example, male regular members engaged in inorganic technology reported median earnings that steadily advanced from $185 a month for those with 4 years of professional experience, to $545 a month for members who had been professionally active for approximately 34 years. Over these same experience levels, the median earnings reported for general industrial chemistry advanced from $195 to $473 a month. In contrast, however, earnings of members in the field of physical chemistry increased from $188 to only $381 a month. At all experience spans, the earnings reported for this field of specialization were only slightly less than those of male regular members in organic chemistry, and only slightly greater than those of male regular members in general chemistry.

The second group of fields of specialization chosen for analysis includes five rather closely related branches of the chemical industry. It is evident from the chart that the earnings capacities in these fields do not differ materially one from another. The average earnings curve of this second group covers the field of specialization designated as petroleum and its products. In this field, median earnings advanced from $200 a month for members with 4 years' experience to $620 a month for those with approximately 34 years' experience Synthetic resins and organic chemical technology showed median earnings slightly above those for petroleum and its products, while rubber and its products, and paints and varnishes showed median earnings slightly below.

Allowing for inconsistencies in the reported data, it is readily seen that the close relationships noted to exist among the earnings for the second group were paralleled by those in the remaining two

16 FEWER THAN 10 MEMBERS REPORTED

groups yet to be considered. The possible exception to this generalization is that in the third group, the earnings capacity in the field of paper and forest products was relatively greater than in any of other five fields in the group, owing to an accentuation in the spread. Reported median earnings of male regular members in this field steadily increased from $178 to $715 a month over the 30 years' experience span that ranged from 4 to approximately 34 years after entering the profession. Among the remaining five fields of specialization in this third group, the average earnings capacity curve can be considered to be that for members engaged in biological chemistry (basic science), where an advance in earnings from $170 to $558 a year was shown. Earnings reported for pharmaceuticals and for foods and kindred products were generally slightly higher, while those reported for agricultural chemistry and for public health were generally lower than those for biological chemistry.

The last group shown in Chart 11 consists of the remaining six fields of specialization which permit analysis of earnings on the basis of years of professional experience. Since the inconsistencies in the data reported for this group do not permit relating the earnings to any one particular earnings curve, it is necessary to consider the two fields which can be assigned as occupying the upper and lower extremes of earnings in each experience span. In general, the highest median earnings of this group in 1941 were reported by male regular members in the field of ceramics, where the general advance in earnings from 4 to 29 years after entering the profession was from $198 to $650 a month. In contrast, the lower limits in earnings covered male regular members in the field of explosives, in which earnings increased from $210 to only $385 a month. Between the limits of earnings in these two fields, in descending order, were found the earnings curves for explosives, "other field of science or engineering", general chemical engineering, nonferrous metallurgical technology, and ferrous metallurgical technology.

Without regard to years of professional experience, Table 35 shows that in 1941 the range in median earnings among the 34 fields of specialization was from $243 a month for male regular members in the field of general chemistry (basic science) to $344 a month for those engaged in the motor vehicles field of specialization. Relative to the median earnings of $300 a month reported for gas and fuels, it is interesting to note that in 16 of the fields of specialization, median earnings were greater, and in 17 the earnings were less.

Again as was noted in the two analyses of earnings by source of employment and by occupational status, between 1929 and 1934, earnings in all fields of specialization declined, while between 1934 and 1941 they increased. In 1934 the declines in earnings ranged from 2 per cent to as high as 51 per cent. In 1941, on the other hand, the increases ranged from 5 per cent to as high as 131 per cent.

Section 15. Median Monthly Salary Rates of Male Regular Members by Geographic Division

Consideration of the earnings data reported for 13 geographical divisions (Table 36) shows that in 1941 these ranged from $230 a month in the Mountain Region to $308 a month in the Middle Atlantic Region. The approximate middle value among this series of earnings was that of $278 a month reported by male regular members located in the East North Central Region. Since the differential between this middle value and the highest was only $30 a month, and between the middle value and the lowest was only $48 a month, it is apparent that insofar as median earnings are concerned the inducement for male regular members to move from one geographic division to another was not very great. This observation, however, is qualified by the fact that the largest number of employment opportunities did exist in the Middle Atlantic and the East North Central Regions.

Earnings in 1929 in the several geographic divisions had uniformly decreased by 1934 from 3 per cent for male regular members then located in the District of Columbia, to 17 per cent for those located in 1929 in the West North Central Region. By 1941, however, earnings in every geographic division had increased. Between 1934 and 1941, the smallest relative increase of 7 per cent in median earnings was reported for United States territories and possessions, and the highest relative increase of 46 per cent covered male regular members in the West North Central Region.

CHART II- MONTHLY SALARY RATES IN 1941 OF MALE REGULAR MEMBERS REPORTING IN SELECTED FIELDS OF SPECIALIZATION ACCORDING TO YEAR OF ENTERING PROFESSION

Section 16. Median Monthly Salary Rates of Male Regular Members by Size of Community

It is evident from the data shown in Table 37 that, in general, median monthly earnings of male regular members in 1941 increased directly with the size of the community. This generalization is borne out by the fact that for all geographic divisions combined, median earnings ranged from $257 a month in communities under 5,000 population, to $301 a month in communities with populations of over 500,000 persons.

Among the several geographic divisions, however, there were a few deviations from the general pattern. The most notable was that of the New England Region in which the highest earnings of $298 a month were reported for communities with populations of from 5,000 to 25,000 persons.

Within each size of community, earnings reported by male regular members from the several geographic divisions generally followed the pattern of distributions of earnings noted in the preceding section.

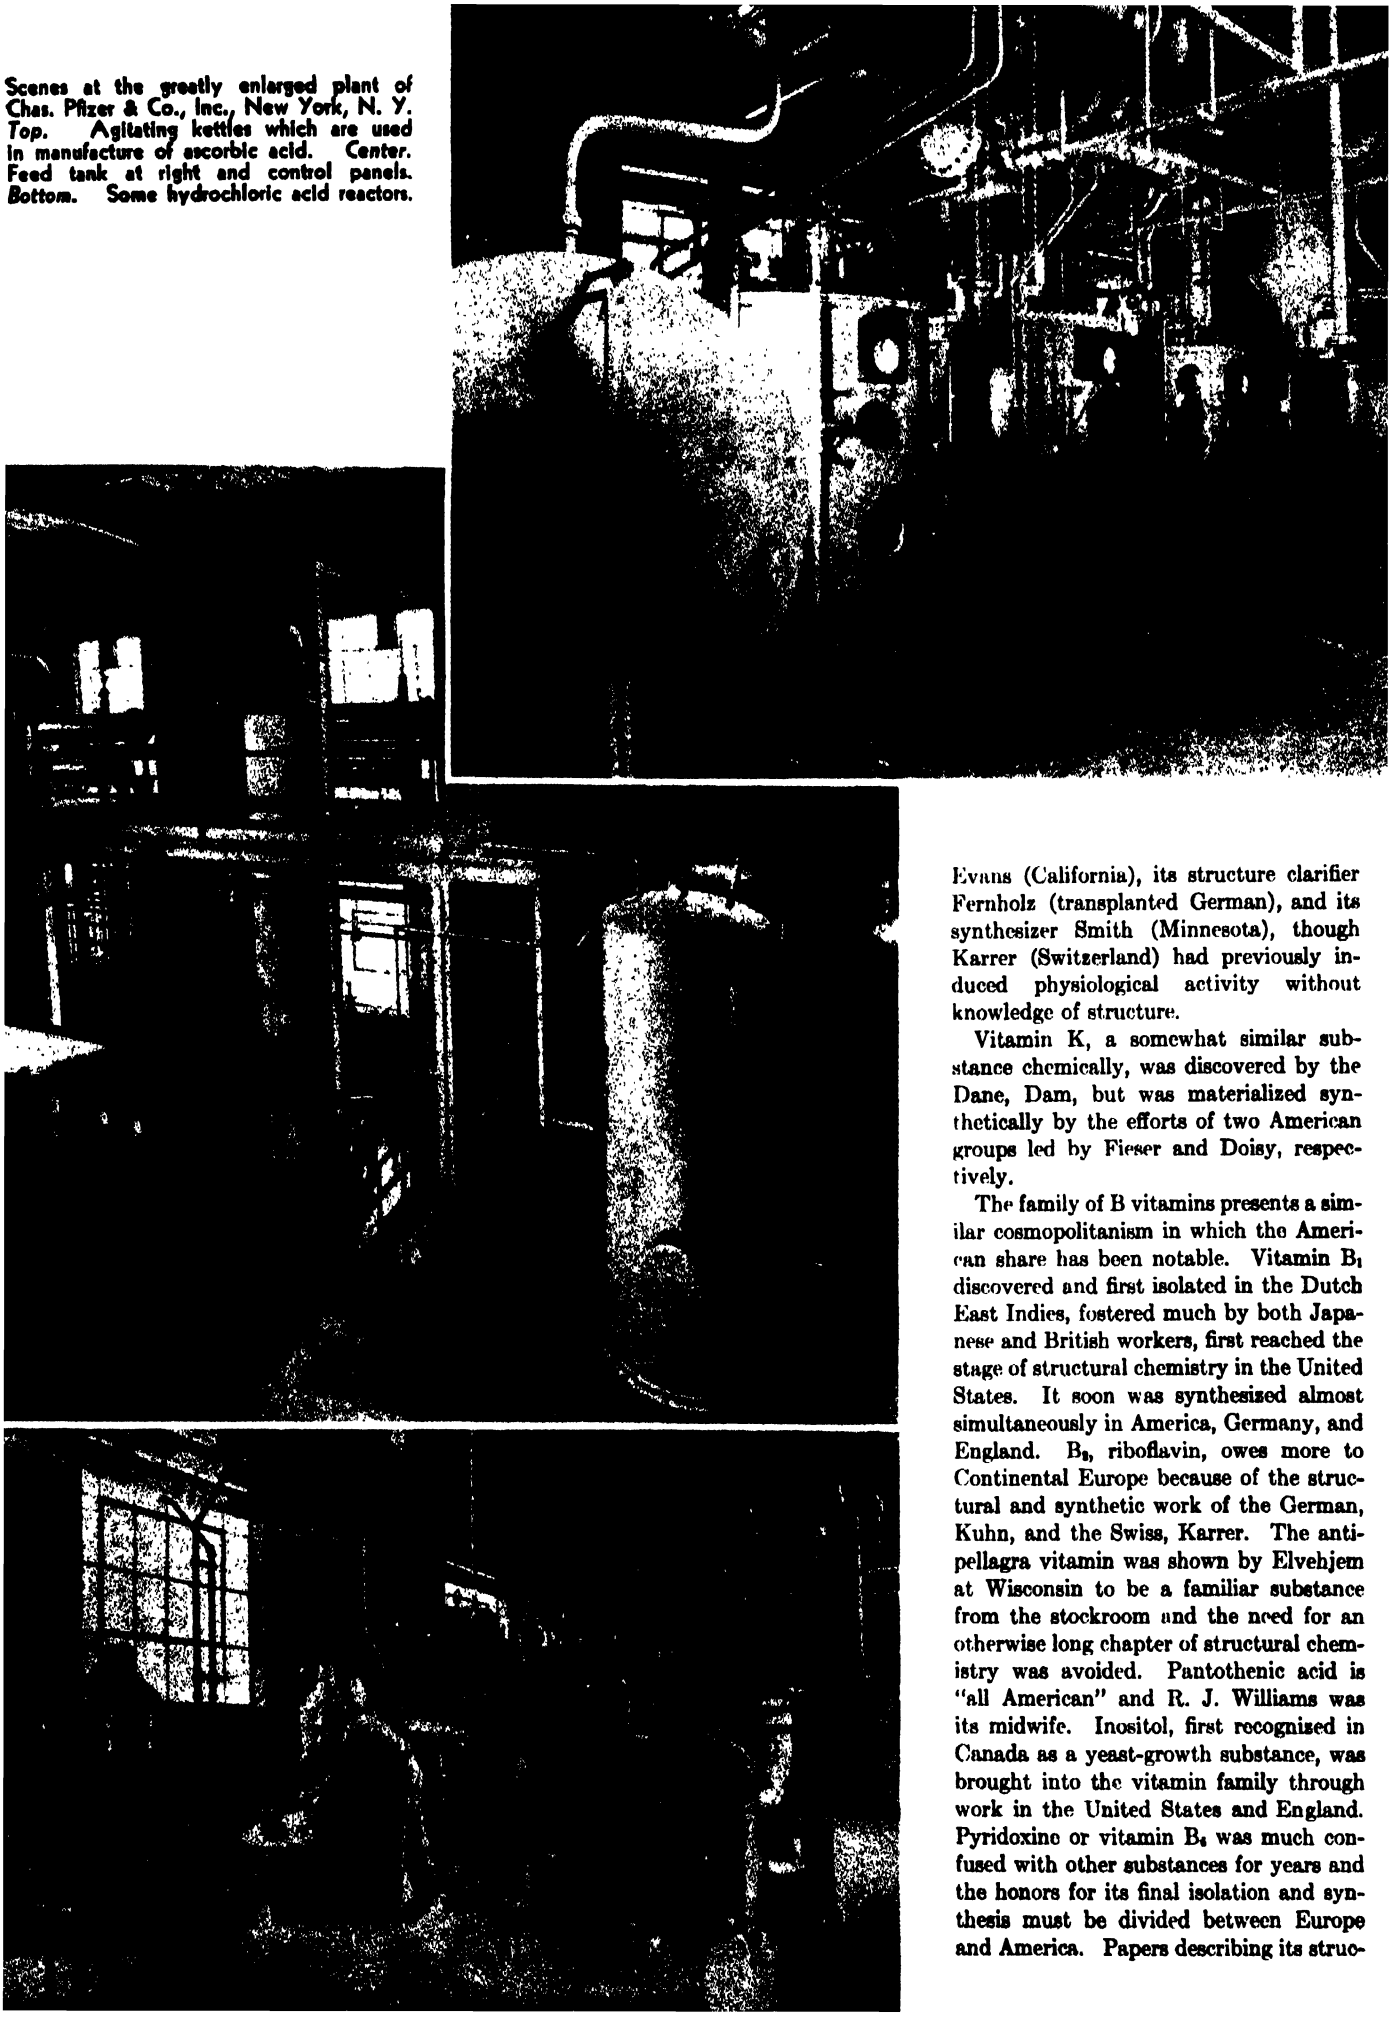
ACTION ON THE AMERICAN CHEMICAL FRONT

[Continued]

American Contribution to Vitamin Production and Use

ROBERT R. WILLIAMS
Bell Telephone Laboratories,
463 West St., New York, N. Y.

MERCK & CO., INC.



Equipment used in the manufacture of vitamin B1 hydrochloride

No country has contributed more to vitaminology than the United States. However, as in most fields of science, there has been international contribution toward the world store of knowledge. Happily, in normal times there are no tariff walls, no immigration laws to strangle the flow of ideas across political boundaries. Scholarship recognizes that any nation which would seek to make itself intellectually self-sufficient would soon and surely render itself intellectually inadequate in science.

The earliest vitamin (A) was indicated by the experiments of an Englishman, Hopkins, but reached more definitive recognition in the hands of Americans, Mendel and particularly McCollum. Carotene was recognized as its precursor in England (Moore), but for precise knowledge of its structure and an academic synthesis we are largely indebted to the Swiss, Karrer. A practical commercial synthesis is still to be achieved, wherefore we feel the pinch of the shutting off of fish liver oils from Norway and have turned to shark fishing, especially in California. An American, Wald, has developed much of our fundamental knowledge of the role of vitamin A in the eye.

Vitamin D, closely associated with and at first confused with A, came to the world's knowledge through the work of the American, Hess, as much as that of any one. It was he who enlisted the German, Windaus, in a study of its structure. This in turn has been useful for the interpretation and control of the reactions which occur when foods are subjected to ultraviolet radiation by the empirical but practically highly useful process of Steenbock (U. S. A.). However, an understanding of rickets and the relation of the disease to balance of calcium, phosphorus, and vitamin D was not attained without aid from every country of the Western World.

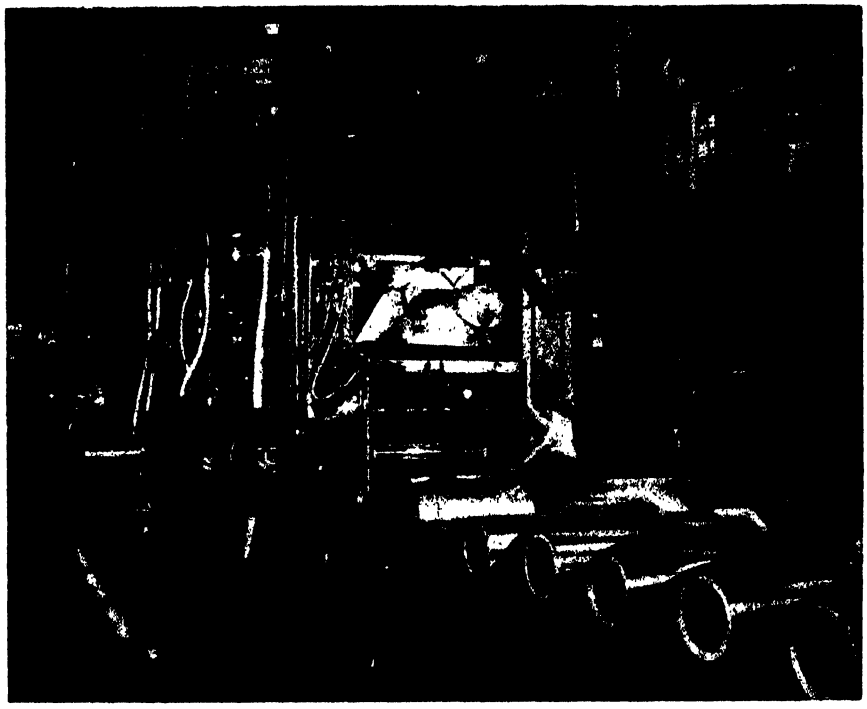
Vitamin E, the remaining long-established oil-soluble vitamin, was largely "made in America" by its discoverer

Scenes at the greatly enlarged plant of Chas. Pfizer & Co., Inc., New York, N. Y. *Top.* Agitating kettles which are used in manufacture of ascorbic acid. *Center.* Feed tank at right and control panels. *Bottom.* Some hydrochloric acid reactors.

Evans (California), its structure clarifier Fernholz (transplanted German), and its synthesizer Smith (Minnesota), though Karrer (Switzerland) had previously induced physiological activity without knowledge of structure.

Vitamin K, a somewhat similar substance chemically, was discovered by the Dane, Dam, but was materialized synthetically by the efforts of two American groups led by Fieser and Doisy, respectively.

The family of B vitamins presents a similar cosmopolitanism in which the American share has been notable. Vitamin B_1 discovered and first isolated in the Dutch East Indies, fostered much by both Japanese and British workers, first reached the stage of structural chemistry in the United States. It soon was synthesized almost simultaneously in America, Germany, and England. B_2, riboflavin, owes more to Continental Europe because of the structural and synthetic work of the German, Kuhn, and the Swiss, Karrer. The antipellagra vitamin was shown by Elvehjem at Wisconsin to be a familiar substance from the stockroom and the need for an otherwise long chapter of structural chemistry was avoided. Pantothenic acid is "all American" and R. J. Williams was its midwife. Inositol, first recognised in Canada as a yeast-growth substance, was brought into the vitamin family through work in the United States and England. Pyridoxine or vitamin B_6 was much confused with other substances for years and the honors for its final isolation and synthesis must be divided between Europe and America. Papers describing its struc-



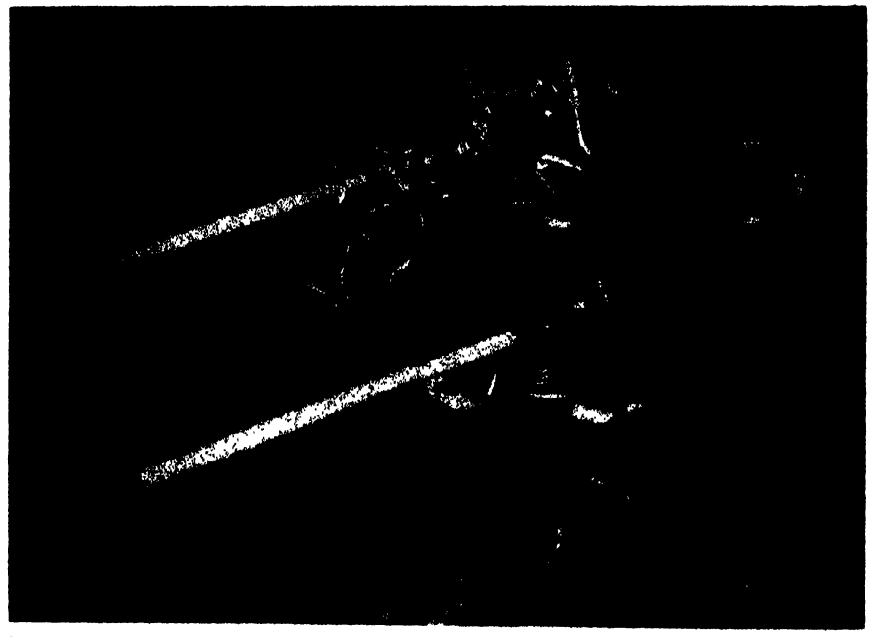
ture and synthesis emanated only a few weeks apart from Rahway, N. J., and Heidelberg, Germany. The story of biotin is not yet fully written, but honors are well divided between Holland and America.

Such also was the case with the long riddle of the antiscurvy vitamin, C. Isolated and recognized nearly simultaneously by Szent-Gyorgyi (Hungary) and by King (Pittsburgh), its structure was learned and its synthesis was achieved in British (Haworth) and Swiss (Reichstein) laboratories.

It is noteworthy that America has performed not only a great share of the groundwork leading to the discoveries of the vitamins but has also increasingly shown herself capable of the fine and highly specialized techniques of micro-isolation and micro-structural chemistry, as well as those of organic synthesis. In the field of the quantity production of synthetic vitamins, America leads the world, partly because the American public is very vitamin conscious and thus affords a good market. Such progressiveness in this difficult field is, however, evidence of the great competence of American chemical factories.

The Aluminum Industry

FRANCIS C. FRARY, Aluminum Co. of America, Pittsburgh, Penna.



Rolling aluminum strip sheet

IN ALLOY and market development and production technique, the American aluminum industry not only has been independent of all foreign sources of information, but has largely anticipated foreign developments. Even in the case of the one alloy development which came from abroad (the German alloy Duralumin) the foreign information was substantially confined to meager patent statements, and the whole technique of production and control had to be worked out independently here.

Aluminum alloy developments began with casting alloys. The one containing about 8 per cent copper was produced in 1894 and is still designated abroad as "American alloy". The early "German alloy" containing a little copper and considerable zinc, was unable seriously to compete in this country and has largely died out abroad. The next important casting alloy developments occurred here shortly after the World War I, when Jeffries and Archer produced the heat-treated cast alloys containing about 4 per cent of copper, and the 5 per cent silicon casting alloy, and Aladar Pacz developed the modified 12 per cent silicon alloy (Alpax, Silumin) which later became very popular in Europe. The heat-treated sand-cast alloys containing 5 to 7 per cent of silicon and a little magnesium and the low-expansion alloys for automotive pistons were developed here about 1930 and have since spread to foreign countries.

Aluminum alloys containing 5 per cent or more of magnesium were investigated here as early as 1906, but were commercially impractical at that time. It was not until 1929 that we were able to work out for the first time casting methods which made it practical to use the 10 per cent magnesium alloy, and in 1931–33 the technique was developed to produce satisfactory heat-treated castings of this alloy having the highest strength of any heat-treated aluminum-base alloy castings. If the use of this alloy has spread to

The exellent machinability of the free-cutting aluminum alloys is shown by small chips which were produced here as a result of machining the rod in the foreground.

foreign countries, it has been only within very recent years.

In the field of wrought alloys, the one prewar alloy other than Duralumin which has stood the test of time is 3S (aluminum with 1.0 to 1.5 per cent manganese), developed here by E. Blough in 1906, and still the most popular of the unheat-treated alloys. It was 20 years before this alloy began to be manufactured to any extent in Europe, but alloys of this type have recently become deservedly popular there.

When the American industry took up the development of the heat-treated wrought strong aluminum alloys, Duralumin was found difficult to forge. Since it was evident that forgings would be essential if strong aluminum alloys were to go into general commercial use, two new alloys (25S and 51S) were developed here primarily to combine easy forgeability with good strength. Small forgings, such as connecting rods, began to be made of these alloys in 1921, and soon forged propeller blanks of 25S and aircraft engine crankcases of 51S began to be produced. It was another 10 years before foreign aluminum fabricating plants took up the manufacture of these large forged aluminum alloy articles.

Two alloys of the Duralumin type with considerably higher strength than the original Duralumin (24S and 14S) were commercialized in this country in 1931, and similar alloys were later developed and used abroad. These alloys are such an improvement on the original Duralumin that they have almost completely replaced it in our aircraft construction.

The idea of protecting corrodible aluminum alloys by a thin surface coating of pure aluminum had been thought of and patented so long before the other war that it had been forgotten. It was rediscovered by the National Bureau of Standards and commercialized in this country, the first Alclad strong aluminum sheet being rolled and tested here in 1926. Subsequently taken up and exploited abroad also, it has proved the complete answer to the protection of thin strong alloy sheet from corrosion by marine atmospheres.

One of the serious problems in the production of strong aluminum alloy forgings is the manufacture of a good forging stock. This was originally done only by the relatively expensive process of extrusion, still used abroad. As early as 1924, a large rolling mill was built here for the manufacture of large billets and structural shapes out of the strong heat-treated aluminum alloys, and in the same mill the technique of producing satisfactory rolled forging stock was shortly evolved. With many improvements that process is producing our present strong alloy forging stock.

Development of the free-cutting alloys of the 11S type in this country in 1932 made available for use on automatic screw machines high-strength aluminum alloy rod. This, in turn, made possible production rates and tool life at least equal to those realized with free-cutting alloys of other metals. Later, various free-cutting aluminum alloys were developed abroad, but so far none appear to have surpassed and few to have equaled 11S.

Forging a strong aluminum alloy propeller blade

The electrolytic refining of aluminum in a molten salt bath, first accomplished on an industrial scale in this country in 1921, produced the first high purity aluminum for metallurgical research. It was also the first time that the electrolytic refining of a metal in a fused salt bath had been accomplished commercially.

Aluminum conductors were first used to carry electricity to the Niagara Falls works of the Pittsburgh Reduction Co. in 1895. After many vicissitudes, the use of aluminum cable for high-tension electric circuits was placed on a firm foundation by the commercialization of aluminum cable steel reinforced in this country in 1907. Trial installations were not made in Europe until about the time of World War I, after the cable had already become an assured success in America.

In the field of anodic finishing, the merits of the sulfuric acid process (originally patented in England) were first recognized in this country and the process developed commercially, together with the necessary sealing and coloring procedures, so that it has now largely supplanted the competing chromic and oxalic acid processes developed abroad. The Alzak process for the electrolytic production of a specular aluminum surface having the reflectivity of a silvered glass mirror was developed here and commercialized in 1934. It was the first commercial use of electrolytic polishing.

In the more strictly chemical field, most of the American developments in the aluminum industry are confidential. As an exception the development in 1928 of activated alumina—a rocklike form of partially calcined aluminum hydroxide which has remarkable properties as a desiccant and as a catalyst carrier—may be mentioned.

The entire history of the aluminum industry is one of severe competition with other metals, wood, paper, plastics, etc. Technical progress in America made the United States the largest and most active market in the world for aluminum products until German war preparations forced the expansion of aluminum there. The present tremendous expansion of the domestic industry involves many improvements ascribable to American skill and ingenuity.

Research in the Service of Medicine

(Pictures on pages 1668-69)

OF INTEREST to physicians, chemists, druggists, and others associated with medical service in the health of the Nation are the new laboratories recently opened by G. D. Searle & Co., well-known manufacturers of ethical pharmaceuticals for more than 50 years.

Dictated by the firm's policy of "Research in the Service of Medicine" many outstanding innovations have been incorporated into the new building which represents a distinct evolution in the manufacture of medicinal preparations.

The heart of the modern, streamlined structure is the Research Laboratory which occupies almost the entire second floor. Functionally, this department consists of three divisions—organic synthesis, bioassay, and analytical—and for each division the equipment has been specially devised for its particular function.

The synthetic organic laboratories, which occupy by far the largest area, are separated by partitions of shatterproof glass to provide complete safety in case of fire or explosion and at the same time to afford perfect lighting. Other safety features include emergency showers over each door, a delayed action sprinkler system to diminish water hazard and dry-ice extinguishers for small or local flames. The laboratory furniture was all specially made, after extensive tests to determine the most perfect materials and design. Each laboratory has a built-in refrigerator for storage of perishable samples or chemicals, work hoods, and safety-glass fronts and remote-control valves.

One of the larger laboratories is devoted solely to the preparation of starting chemicals, so that valuable research time need not be lost in doing routine preparations of otherwise unavailable materials. A pilot plant is also included in this unit and serves the double function of providing large-scale apparatus for chemical preparations as well as acting as intermediary in working successful products up from laboratory scale to full chemical manufacture. Other laboratories, similar in design and equipment to the organic laboratories, are reserved for biochemistry, which deals with products isolated from natural or living sources. In such isolations, the pilot plant is also invaluable owing to the large volumes frequently encountered.

Once a compound has been synthesized or isolated from a natural source, it is necessary to evaluate it as a potential drug. For this purpose completely equipped laboratories have been provided for bacteriology and for pharmacology. Bacteriology consists of one laboratory devoted to more delicate operations, such as culturing, transferring, and observation, both macroscopic and microscopic. The adjacent laboratory is used for preparing, sterilizing, and storing culture media, as well as for washing glassware and incubating specimens. The function of this division is also two-fold—the bacteriologic evaluation of new compounds and the manufacture from the standpoint of sterility precautions.

The Pharmacology Department consists of three laboratories on the research floor, directly connected with animal rooms in the basement by means of a private dumb waiter. This department, like the others, has a dual function in that it performs routine assays of all biologically assayed materials marketed by the company. By far the major effort, however, is devoted to the systematic evaluation of all new compounds prepared within the Research Department and the follow-up of products until they are ready for clinical trial. Physically this division is replete with kymographs, muscle levers and warmers, microtome, and all specialized paraphernalia which makes evaluation of drugs a science rather than an art.

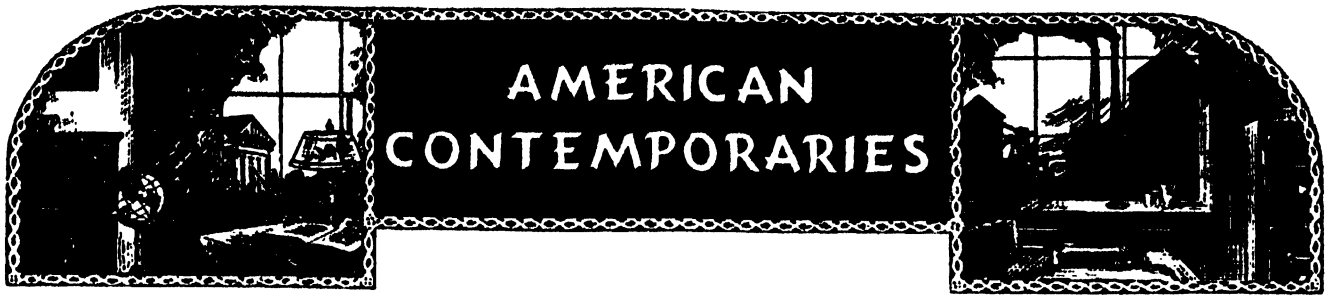
The Analytical Division occupies the west wing of the research floor and, because of the specialized nature of modern analytical procedure, is divided into a number of separate units. The largest is devoted to the analysis of all incoming materials and intermediates manufactured by the company, to be certain of identity and purity, and all out-going products.

A similar unit is found in the micro-analytical laboratory. This is a technique which has been developed during recent years, whereby with suitable equipment and specially trained technicians, the most precise analyses can be conducted upon unbelievably small amounts of materials. This is a real consideration when dealing with the tiny quantities which are frequently encountered both in biological isolations and as breakdown products in determining the structure of unknown compounds preliminary to their synthesis.

An optical room with its adjoining dark room completes the Analytical Division. This is included in the division because of the constant increase of new techniques and methods which employ optical and frequently photographic instruments for the perfection of the analysis, reduction of labor, or, most important, the precise measurement of smaller and still smaller amounts of material. It is such procedures that allow the pharmacologist to follow a drug in the animal body and to study the intimate mechanisms of its function and excretion.

A new feature of the manufacturing laboratories is that raw materials are delivered to the center of the building and from there distributed to the analytical, research, or manufacturing laboratories as requested.

The manufacturing process takes place under ideal conditions as to arrangement of apparatus, light, space, sanitation, air conditioning, and humidity control. Of particular interest is the extensive ampuls department. Examination of these laboratories by visitors is controlled by glass-walled passageways, where inspection can be made without interfering with operations and without danger of contamination.



Friendly employee-management relations and the well-being of its workers have always been strong considerations of G. D. Searle & Co. This is evidenced by the spaciousness and beautiful appointments of the lounge, dining room, recreation hall, and auditorium, occupying the entire wing of the basement. The auditorium, in addition to being used by employees for meetings and entertainment, will also be made available to local medical and chemical societies which may wish to hold meetings there. A well-appointed hospital room is under the supervision of one of the physicians on the Searle staff.

The general offices are located in the upper tier of the building. In addition to the space and facilities for the office staff, there is a large lecture room devoted to the schooling of retail representatives.

The structure from the outside is unusually modern. There is no hint in its appearance of either factory or office building. It is what is popularly known as a streamlined building, and is considered an outstanding example of modern architecture where functional facilities are allied with simplicity and beauty.

The building is air-conditioned and humidity-controlled throughout. The various laboratories and offices are soundproofed. The fluorescent lighting is indirect and shadowless—approximating ideal daylight conditions.

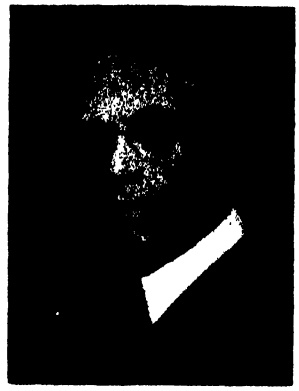
The building is set on a tract of land in Skokie, which is a nonindustrial section on the northwest limits of Chicago.

William Flowers Hand

IF ONE is passing the Mississippi State Chemical Laboratory at midnight he should not be startled to hear a voice from a southwest window. At first he may think it is a radio giving the midnight news. However, in a few moments he will hear the voice say, "paragraph". It is merely the voice of the character of this sketch putting a few letters on the cylinder, for it would be a crime to take the secretary's time dictating at eight the next morning. Long before World War I, Dr. Hand bought an automobile for himself and a dictaphone for the office. He soon solved the simple mechanics of the former; so he sold it. However, it was a man-sized job to keep the old dictaphone going; so after wrestling with it for a third of a century, World War II found him trading it in for a new Ediphone.

While some chemists may dream of sudden inspiration or of fortuitous scientific prescience, others realize that through years of continuous service they may arrive at a goal which far surpasses the conclusions of any particular piece of work accomplished over a much shorter interval of time. That Dr. Hand has attained such a goal in the hearts of the people of Mississippi is shown by the fact that in May 1940, at an impressive ceremony, there was unveiled in the hall of the Mississippi State Chemical Laboratory a bronze tablet which reads, in part, as follows:

MISSISSIPPI STATE COLLEGE



CHEMICAL LABORATORY

A Tribute To

DR. WILLIAM FLOWERS HAND, SCIENTIST,

Whose unselfish service, tireless energy, and devotion to the education of the youth of Mississippi, and whose distinguished activities as State Chemist, merit the naming of this building in his honor

With the exception of brief periods of study under Dr. Mallet at the University of Virginia, and under Dr. Bogert at Columbia, Dr. Hand's entire life has been spent in the State of Mississippi, where he was born on December 1, 1873. In 1899, Mississippi State College made him professor of chemistry and state chemist (membership in the AMERICAN CHEMICAL SOCIETY also dates from this year). He has more than doubled the combined tenures of his four predecessors. Since 1916 he has been dean of the School of Science and in 1935 he became vice president of the college. This long term of service proves beyond a doubt his love for and loyalty to the college, and we find this account interwoven with reference to the college and to his students.

HARRIS AND EWING

William Flowers Hand

One might well say that the sun never sets on Dr. Hand's students. They occupy positions all over the United States and its possessions. One of them devised a popular breakfast food, another has refined sugar in several countries, recently another took over a major oil company's largest refinery, and still another made a success in the field of television after serving his apprenticeship in Dr. Hand's tool room. Many have taken advanced work in large universities and all have been commended for their thorough background in organic chemistry and in chemical literature, taught by Dr. Hand.

When Dr. Hand first came to Mississippi State College as a student, there were only three books and no periodicals in the chemical library. Today it contains approximately 6,000 volumes and 50 journals, all carefully chosen. It serves as a substantial nucleus for Dr. Hand's goal, a new chemistry building equipped for chemical engineering, which he feels is essential for the South in bringing about the much needed balance of agriculture and industry.

The present laboratory was designed and built under his direction, and has been the object of much favorable comment. The students say that the halls were laid with hexagonal tiles which represented benzene rings that would aid Dr. Hand in arriving at a more difficult aromatic structure to give them for memory. In this laboratory is a well-equipped tool room. Here Dr. Hand has put to good use his hobby, which is the design and building of apparatus. Many an afternoon after a hard day he turns on the motor to his lathe. Products of his "relaxation" are almost masterpieces. The needle valves for fat extractors are precisely turned and well-buffed brass outshines the polish of cherry and mahogany. And, speaking of cherry and mahogany, one must mention the unique fat extractor which Dr. Hand built at a time when no extractors on the market gave almost complete recovery of ethyl ether. The extractor which he constructed meant drops of ether saved—representing not only an advance in scientific apparatus, but a saving of money which in turn meant more books or journals for the chemical library. This particular extractor was set in cherry wood which an old Englishman had hoarded for over a quarter of a century. He would not part with enough for all sections; so some were set in equally beautiful mahogany. The beauty of the apparatus did not interfere with its usefulness, for certain sections have been in daily use for over 20 years.

Many other pieces of apparatus have resulted from Dr. Hand's labors and a compact battery distillation for petroleum was finished and in operation in his petroleum laboratory before there was one on the market. Mississippi is believed to be the second State to purchase an A. S. T. M.-C. F. R. motor for the regulation of octane rating of gasoline, and now a cetane motor for fuel oils has been added.

Dr. Hand has not chosen to patent or capitalize on any of his apparatus, using it instead for the service and prestige that it might offer his school and state. On his office mantle are two beautiful silver cups, each won three times before becoming permanent possessions. These were the result of analytical success on a series of check samples sponsored by the American

Oil Chemists' Society. The apparatus used throughout the analyses was HAND built. When the society made the first award to him in 1927 and requested his photograph, he sent instead a picture of the laboratory. With all his success, he has never sent out one word of publicity for himself. Perhaps his mother, Florence Flowers Hand, who taught school until she was well past 70, taught him that self-praise was half scandal, or his father, Albert Powe Hand, may have told him that the boys would find the path to his laboratory if he built the right rat trap.

Despite his deliberate efforts towards self-effacement, Dr. Hand's work and worth have been widely recognized. He is listed in American Men of Science, Who's Who in American Education, Who's Who in America, and on the rolls of many honorary societies. In 1941 the Georgia Section of the AMERICAN CHEMICAL SOCIETY selected him as the recipient of the Herty Medal. When he received the unexpected telegram of award he was very much embarrassed, for he claimed to have "no consciousness of such praiseworthy achievement". Although this rendezvous, with the pilgrimage to Milledgeville, was kept under a great physical handicap, the day had not ended until everyone felt that the spirit of Charles Herty still lived.

The position of state chemist automatically made him an active member of the Association of Official Agricultural Chemists, and he has served on many of its important committees, including an eight-year term on its journal editorial board. In 1921 he was its president. He has also been president of the Association of American Feed Control Officials, the Association of South Central States Food, Feed, Drug, and Health Officials, and the Southern Feed Control Officials. He aided in revising the inadequate fertilizer laws of Mississippi and in preparing the original feed, paint, and petroleum laws. In his nearly half century as state chemist he has personally done considerable toxicological work, compiling forensic data on many a poison case, some of national note.

Dr. Hand has not been immune to the usual campus tales, so we hear of scrapes that he got in and out of while in college, and of his absent-mindedness and forgetfulness which equal those of the professor in fiction. However, those who work with him report that he remembers everything about everyone. He keeps up on the news of the day, too, and would easily stump the average person in a discussion of current events. Once in a while he spends an evening swapping yarns with the Sigma Alpha Epsilons or attends a college social affair. It is said that in his younger days he used to slip away from the formal dances, pull off his "tails", push up his cuffs, and work a little more on his intriguing "quinazolines"—while the band played on.

Dr. Hand's Chesterfield manner has become an example that could easily be used as an additional course for the four years of a college boy's life, for he always maintains poise and equanimity through storm and tempest, before friend or foe, superior or subordinate. He has always been a great lover of children and those of the Mississippi State College campus look forward to his Christmas gift with the same confidence they look to a visit from Saint Nick himself. Unfortunately his only child, Wiley Nash Hand—a U. S. Naval Academy graduate in 1921—died in 1936.

In 1940 Dr. Hand had a coronary thrombosis. The forced eight weeks' leave from the laboratory was more painful than the cardiac pain itself. Although the physician recommended additional weeks off and shortened hours on return, he immediately punched the clock along with the other faculty and the Ediphone and the lathe were soon getting their nocturnal workout. Early 1943 will see a new feed and fertilizer mill emerge which removes the imperfections of a former one that was superior to any stock mill for cutting and mixing samples.

This brief account reflects only in a small way his real tenacity and his failure to compromise with accomplishments which are not the best. It is not entirely luck that Mississippi State College students hold their own with those from larger institutions. Dr. Hand once told an analyst who suggested that he did not have the time to check samples from all over the United States that, "We shall always find the time to measure ourselves by the other fellow's yardstick." It is now realized that the unsaid portion of his sentence was—"and we'll see that our own measures with the best".

M. P. ETHEREDGE

Department of Justice Charges Monopolistic Practices

THE Department of Justice on December 9, 1942, filed a complaint in the United States District Court at Trenton, N. J., charging seven manufacturing companies, two trade associations, and a testing laboratory with monopolistic practices and restraint of trade in the fluorescent lighting industry.

Named as defendants in the complaint were: General Electric Co., International General Electric Co., Westinghouse Electric & Manufacturing Co., Corning Glass Works, Consolidated Electric Lamp Co., Claude Neon Lights, Inc., N. V. Philips Gloeilampenfabrieken, Reflector Lamp Manufacturers' Institute, Fleur-O-Lier Manufacturers, and Electrical Testing Laboratories.

National Safety Council Officers

THE following members of executive committe, Chemical Section, National Safety Council, have been elected for 1942–43:

General Chairman, Major R. C. Stratton, CWS, Office of the Chief of Ordnance, Safety & Security Branch, Chicago, Ill.
Vice Chairman in Charge of Program, James J. Duggan, Carbide & Carbon Chemicals Corp., South Charleston, W. Va.
Secretary, H. F. Gilbert, American Cyanamid Co., New York, N. Y.
News Letter Committee, Allen L. Cobb (Chairman), E. F. King, W. C. Shaw.
Engineering Committee, D. O. Mason (Chairman), E. G. Meiter, E. J. Sait.
Data and Instruction Card Committee, R. S. Mackie (Chairman), R. C. Hamilton, John W. Sawyer.
Health Committee, S. W. Gurney (Chairman), Leonard Greenburg, S. M. MacCutcheon, H. H. Schrenk.
Membership Committee, C. E. Sevrens (Chairman), W. L. Hammersley, James H. Hayes.
Poster Committee, M. R. Budd (Chairman) and P. C. Lamb.
Statistics and Contest Committee, M. A. Snell (Chairman), E. J. Riederer.
Advisory Committee, F. W. Dennis (Chairman), R. O. Keefer, R. L. Rogers, Jr., H. L. Miner, John Roach, John S. Shaw, A. L. Watson, S. E. Whiting.

Data Published on Selective Service

BECAUSE of the wide interest in this subject and the need for obtaining trained men for our Production Army, we give below references to information we have published on occupational deferments, including those of men in training, and the need for technically trained persons. Future developments will be brought to the attention of our readers.

WORLD-WIDE CHEMISTRY

Pulp and paper production in Canada in 1939 amounted to 4,500,000 tons. The production of pulp and paper for export was 4,300,000 tons, including 2,900,000 tons of newsprint. Production value total was $208,000,000 and production for export was recorded as $201,000,000.

Dehydrated Food Supplies Controlled

Supplies of dehydrated fruit, vegetables, and eggs processed in Canada are controlled by the Special Products Board of the Department of Agriculture. This board was established to provide a central agency for obtaining and exporting to the United Kingdom's food ministry any "special product" that may be required. Dehydration processing of eggs in Canada has reached a high stage of efficiency under skilled scientific control.

Fisheries Experimental Station Is In New Quarters

The Experimental Station of the Fisheries Research Board, located at Prince Rupert, B. C., for many years, has been officially transferred to Vancouver, partly in order to take advantage of facilities offered by proximity to the University of British Columbia.

Drawn Glass Is Made In Canada

Prior to the war 70 per cent of the window glass used in Canada was imported from Belgium. With the usual sources of supply cut off, the continuing demand for this, as for so many war materials, has been met by the establishment of a new industry in the Dominion. The method used in the Canadian plant is one of two mechanical systems in general application in the glass industry in both Europe and America—namely, the Fourcault vertical drawing process using asbestos-covered steel rollers. Minor modifications in the process have been introduced to meet domestic requirements. In addition to the usual single and double thickness window glass, two other grades are being made. A thin glass provides suitable material for watch crystals and a heavy product serves as safety glass when combined with a filler of plastic sheeting for table tops and many other purposes.

Brewing Industry Is Being Restricted

An order curtailing operations of the brewing industry in Canada became effective November 1, 1942. From that date no brewer is permitted to use more malt for producing beer in any quarter than the amount used in the corresponding quarter of the preceding year. A substantial saving in manpower is expected through the resulting reduction in distribution and sales promotion operations, in which the brewing industry has a large employment.

Beet Sugar Production Declines

Returns for 1941 show that production of sugar of all kinds in Canada amounted to 1,212,550,000 pounds including 1,010,873,000 of cane sugar and 201,677,000 pounds of beet sugar. This represented a gain of 67,669,000 pounds in cane sugar over 1940 but a decrease of 11,924,000 pounds in beet sugar output. Establishment of a new beet sugar plant in Manitoba in 1940 resulted in a rise in production to 213,602,000 pounds in that year representing 18.5 per cent of the total sugar output. Plant breeding studies are in progress in western Canada looking to the betterment of sugar yield and increased tonnage per acre of sugar beets.

Pulp and Paper Making Is Important Economic Factor

In 1940 newsprint made up 64.5 per cent of the volume of output; pulp, 20.5 per cent; paper boards, 9.2; wrapping paper, 2.6; book and writing, 1.9; tissue paper, 0.6; and other papers, 0.7 per cent.

An electrical power conservation program, involving 36 Ontario and Quebec mills where 82.5 per cent of production capacity of the industry is located, has been announced. The power saved by this plan will be diverted to war plants in areas where a power shortage threatens.

The growth of the pulp and paper industry has been phenomenal. In 1913 Canadian mills converted 1,000,000 cords; in 1940, 7,000,000 cords. Employment has more than doubled and now stands at 35,000 persons; wages paid have increased from $11,000,000 to $56,000,000. The purchasing power of the industry is very great. Chemicals used cost $13,000,000 a year. It is the largest user of sulfur in Canada. Liquid chlorine, lime, salt cake, caustic soda, limestone, common salt, and alum are among other chemical products used.

To ensure a continuous supply of wood, the industry is endeavoring to operate the forests on a "sustained yield" basis. By scientific cutting it is not only possible to ensure that the forest will regenerate itself but that the new forest will be even more valuable than the original virgin stands.

Research on utilization problems is being pursued steadily. Work on tree-breeding is making good progress.

Chemical Control In Canada Coordinated with U. S. Program

Closely coordinated with the United States program, Canada's control of chemicals and allied products is being exercised on a common-sense basis, the Chemical Controller told a local group of chemists at a recent meeting. Plenty of authority has been provided for any necessary action but cooperation of producers and consumers has been so effective that it has not been necessary to take drastic action.

The use of chlorine as a bleaching agent in paper making has been reduced in line with similar action in the United States; use of glycerol except for explosives is limited; synthetic resins and lacquers are subject to control; the number of colors of certain condensation type products has been reduced; importation of specified chemicals has been put under license; molasses, natural gas, gums, resins, balsams, dry colors and pigments, crude drugs and their derivatives, and albumin have been defined as chemicals;

EDITOR'S NOTE. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

use of coal tar for road construction is possible only under permit; and the disposal of spent lye is controlled. Sal-ammoniac skimmings are being conserved. A plastics advisory committee and a dyestuff advisory committee have been appointed.

Prices Order Freezes Business to Present Lines

Conservation of materials and manpower is one aim of an order restricting the establishment of new businesses or the expansion of existing retail, wholesale, and manufacturing concerns.

The order is also aimed at the maintenance of a greater degree of stability for those engaged in trade and industry amidst the difficulties imposed by wartime conditions.

War Regulations Limit Use of Chemical Products

East of the Manitoba-Ontario boundary the manufacture, import, packing, mixing, storage, sale, delivery, and use of fertilizer are under control and the composition of fertilizers is limited to specified mixtures.

Natural varnish resins may not be used in the manufacture of paints for barns, freight cars, or road marking. An exception is made in the case of Batu gum of which one-half pound per gallon of solids may be used in road-marking paint.

Supplies of rotenone-bearing materials are restricted to certain specified uses.

Synthetic Rubber to Be Produced

Canada has undertaken to supply its own needs of synthetic rubber for tire treads by the construction of a plant with a production capacity of over 30,000 tons per year. The type of synthetic rubber to be manufactured is Buna S.

The use of natural rubber for strictly civilian needs has been stopped and the National Research Council's rubber laboratory, in cooperation with government departments, has carried out and is still working on numerous investigations looking to the reduction of the percentage of rubber required in war products. As the new synthetic rubbers arrive the rubber laboratory will be used to determine which is the best synthetic to use instead of natural rubber. The National Research Council and the Dominion Experimental Farm are collaborating on the problem of cultivating rubber-bearing plants in Canada and extracting the rubber from them.

S. J. Cook

140 Broadway Ave.
Ottawa, Canada
November 14, 1942

Continental Europe

A new company, Standard-Kuhlmann, has been formed in Paris with a capital of 5,000,00 francs. The shares have been taken over by the chemical combine Kuhlmann, Standard Française des Pétroles, Société Immobilière Chimique, and Société Commerciale pour Agriculture et Industrie.

Kuhlmann Enters Motor Fuel Field

The new company will engage in the production and sale of chemical products, particularly fuels, lubricants, and substitute fuels. Evidently it is intended to make use of Kuhlmann's experience in the chemical field and Standard's experience in the sale of motor fuels and lubricating oils.

Collaboration of Rubber Manufacturers

French rubber manufacturing companies are reported to be supplied with limited quantities of synthetic rubber of German origin. The first of these supplies were received at the beginning of 1942. A closer collaboration of German and French rubber manufacturers is sought. About five French firms are usually brought into closer contact with one German firm which hands over to the French manufacturers its patents and experience in return for financial advantages. Thus Etablissements Hutchinson report that they are collaborating with Semperit Gummiwerke A.-G. of Vienna and have transferred to that company half of their financial interests in Spain and Italy. Hutchinson will, on the other hand, dispose of Semperit processes to about 20 smaller firms in France.

Oil Refineries Damaged in Raids

Compagnie Française des Pétroles reports that it has received the sum of 24,000,000 francs for war damage, and hopes to receive further payments during the current year to compensate for the considerable damage to the company's refineries in Normandy. Of the four French oil refining centers, three are in occupied France, and while none of these is in a position to continue operations on anything like the normal scale, further damage seems to have been caused in at least one of them—Le Havre—by air raids which prevent even operations on the limited scale possible with substitute fuels.

Magnesium Production Financed by German Bank

Thanks to her large deposits of first-class bauxite, France plays a prominent part in the continental aluminum industry, and according to German press reports, full use is being made of these possibilities. Meanwhile the production of magnesium is said to have been increased also. The two leading producers are Péchiney and Ugine, and the raw materials are dolomite (ample supplies of which are available in various parts of the country) and salt precipitations on the Mediterranean Coast. The funds required have been obtained through the agency of Aero-Bank, the Paris branch of the German Bank für Luftfahrt A.-G.

Oil Prospecting Work Unsuccessful

Oil drilling has been continued in the Haute Garonne (southwest France) since gas was found at Saint Gaudens, but no oil has been found in the wells, and the prospectors have moved somewhat to the west, to the region of Boulogne-sur-Gesse. In the meantime a gas pipe line is being laid from Saint Marcet to Toulouse where the natural gas is to be utilized.

Special attention has been paid of late to transferring to war-essential production surplus labor in industries catering to civilian needs. Several chemical trades have been affected by this new policy, which is the special task of the Reich Minister for Armaments and Munitions. The desired concentration has not in all cases been effected without opposition from the manufacturers concerned. While it is intended to take as many workers as possible from civilian manufacture, the firms which specialize in these products are apparently to be preserved. Plants which are closed down usually receive a quota which they are entitled to sell. The goods are supplied by other firms which have been allowed to continue operations, and the owners of the closed plants act as wholesalers, selling goods at specified prices to their old customers. Arrangements of this kind have been made in the soap, acetic acid, and vinegar industries. Settlement of accounts is undertaken by a central organization such as Efag Essigfabrikanten G. m. b. H., a company established for this purpose

by the acetic acid and vinegar manufacturers. At the same time, however, a genuine concentration of production in efficient plants with corresponding changes in financial control is also taking place. Thus Kohlensäure-Industrie A.-G. has been formed with a capital of 5,200,000 marks for the amalgamation of several manufacturers of carbonic acid.

New Uses for Lignite Briquets Developed

Lignite briquets have always been a favorite household fuel in central and eastern Germany, and they have also been used on a large scale as an industrial fuel in these districts. Lately, however, several new applications have been developed. Briquets made of lignite which has been dried at raised temperatures are said to provide an improved low-temperature carbonization coke which, owing to its better physical properties, can be used for metallurgical purposes for which coke made from ordinary lignite is not suitable. In the Rhineland special lignite briquets are now being made for use as a fuel in mobile gas producer plants. These briquets can be used as the sole fuel in specially designed generators or in a 1 to 3 mixture with ordinary wood in all other generators.

Loss of African Phosphates Means Fall in Fertilizer Production

North Africa has been an important source of minerals such as iron ore, molybdenum, antimony, and cobalt for the Axis ever since the collapse of France, but more important still has been the supply of rock phosphates from Tunisia and Morocco. The total amount of rock phosphates shipped from French North Africa in January–August, 1942, was 1,600,000 metric tons, and a substantial part of this is believed to have reached Germany. Recent reports by superphosphate manufacturers in Germany showed a surprising contrast between firms operating in the north and those with factories in the southern parts of the country. While those on the North Sea and the Baltic Sea which normally obtain rock phosphates by sea through the Atlantic reported that their manufacturing activities were almost completely interrupted, firms in Bavaria were able to present somewhat more satisfactory reports. It is possible that firms nearer to Mediterranean ports received African rock phosphates via Marseilles or Genoa. These imports have now been stopped, and Germany must in future depend entirely on bone products and basic slag in so far as phosphatic fertiliser materials are concerned, as the Continent of Europe possesses hardly any natural sources of phosphates, with the exception of Swedish apatite. The Axis must also feel the loss of oil seeds and vegetable oils from North Africa.

Study Group Formed for Medicinal Plants

A Study Group for Medicinal Plants has been formed by German pharmacists, physicians, and scientists, to investigate properties, possibilities of cultivation, and applications of medicinal plants which can be grown and collected in Germany. For some years the German authorities have paid attention to the possibility of growing in other European countries, especially in southeastern Europe, medicinal plants and herbs of a kind which used to be imported from overseas before the war. German machinery and finance were provided for the cultivation of poppies, for the manufacture of opiates, in Slovakia and Hungary, and only recently Germany placed an order for 7,500 tons of medicinal herbs with Bulgaria where, on German initiative, a state control office for the export of medicinal plants was established as early as 1940. These efforts to obtain large quantities of medicinal plants from other European countries do not seem, however, to have been entirely successful, for in the inauguration meeting of the Study Group it was stated that the opportunities for cultivating medicinal plants in Germany were more variegated than in other countries and that the neglect of indigenous medicinal plants was to be made good by systematic research and propaganda among the public.

New German Interests in Southeastern Europe

The Uljanik Petroleum A.-G., Zagreb, has increased its capital from 15 to 30 million kuna. As only half the old capital has been paid in, it appears that a considerable extension of activities is intended. The company is interested in the exploitation of oil and gas deposits in Croatia and is connected with the Methan A.-G., Zagreb, which makes carbon black in two factories at Bujavica and Kutina and is controlled by the German Rütgers interests.

The Titanit Co. at Mahicno near Karlovac in Croatia has changed its name to Company for Explosives and Chemical Products and increased its capital from 4 to 8 million kuna. The Juganil Co. is a new company which sells aniline dyestuffs and chemical products in Serbia. Both these companies are believed to be under the control of I. G. Farbenindustrie. The Chemikal A.-G. of Vienna is reported to intend the erection of a factory for chemical products, including saccharin, in Bulgaria.

Fibers Made from Mulberry Tree Bark

The German Mulberry Raw Material Study Society has developed a process for the manufacture of a new fiber, said to possess great tensile strength, from the bark of the mulberry tree. It is reported that the Bulgarian Government intends to erect a state factory for processing the bark at Harmanlii. The collection of bark is to begin this year, and 2,000 tons of mulberry cell-wool are to be produced annually. The finished product will presumably be sent to Germany for use in the textile industry there.

Rumanian Crude Oil Exported to Germany

Contrary to earlier plans which found expression in the new Rumanian Petroleum Law, it has now been decided to permit exports of crude oil from Rumania, subject to certain conditions. (1) Exports of crude oil are permitted only if the crude oil has an octane number of 66 or less. (2) Exports will not be allowed to reach proportions which would endanger the supply of adequate quantities of crude oil to domestic refineries. (3) Exporters must deposit the difference between the domestic and the export price for the best crude oil qualities, so that the price advantage in favor of the exportation of crude oil is eliminated. (4) The exports of crude oil must not exceed an absolute maximum which is fixed for every month.

The principal buyer of Rumanian crude petroleum, as well as of Rumanian oil products, is Germany under present circumstances, and it would appear that the alteration of the original plans is due to pressure from German refineries which rely on Rumanian oil to provide raw material not only to keep their plants in operation but also to blend with inferior products obtained from other raw materials. This aspect of Rumanian oil supplies for Germany has increased in importance, but it is certain that considerable quantities of petroleum products refined in Rumania are dispatched directly to the German armies in Russia.

Karpathen Oel A.-G. Formed to Develop Polish Oil Deposits

A new company—Karpathen Oel A.-G.—has been formed at Lwow (Poland), with a capital of 30,000,000 zloty. The amount of capital indicates that the new company is to play a prominent part in the European petroleum industry, and practically all firms with important interests in the German oil industry have participated in financing the new enterprise. The founders include Kontinentale Oel A.-G. (a joint company of German oil producers for participation in foreign oil ventures),

Deutsche Gasolin A.-G. (a subsidiary of I. G. Farbenindustrie), Wintershall A.-G. (the leading potash, magnesium, and oil combine), Gewerkschaft Elwerath (a successful German oil producer), Preussische Bergwerksund Hütten-G. m. b. H. (the state-owned mining company with important interests in the oil, metal, and chemical industries), and Grossdeutsche Schacht-und Tiefbau A.-G. (the leading oil well-drilling company). The Karpathen Oel A.-G. is authorized to search for oil, produce, refine, and export it, and also to deal with natural gas and other bituminous substances. It may take over existing producing and refining installations, but its sphere of activities is limited to the Government-General—i. e., that part of Poland which has been neither incorporated into the Reich nor included in the Ostland region. It will devote special attention to the known oil deposits at the foot of the Carpathian Mountains, which have given the new company its name. Most of these were taken over by the U. S. S. R. in 1940/41, and after the withdrawal of the Soviet forces most of the wells and refining installations were destroyed, so that the Germans have been faced with great difficulties in their attempts to resume operations.

Chemical Industries in Eastern Provinces Expanded

Ostschlesisches Holzimprägnierwerk Guido Rütgers G. m. b. H. has been formed at Vienna with a capital of 300,000 marks. It is a subsidiary of the Rütgers company which holds large interests in the tar and asphalt industry. The new company is to engage in the impregnation of wood in East Silesia and to manufacture asphalt and tar products and impregnation materials.

Glanzstoff-Fabrik Lobositz A.-G., a rayon producer of Czecho-Slovakia, reports that extensive conversion and renovation work is going on in its plant. Stolberger Zink A.-G. reports that its production program was on the whole fulfilled last year.

Economies in Alloy Metals Effected by Standardization

Standardization as a means of effecting economies in the use of metals and chemicals has made considerable progress during the war, and the number of similar articles now made by German manufacturers of metal products has been so greatly reduced that on an average only 20 or 30 per cent of the prewar selection is now available. Often the standardization has been accompanied by a distribution of the permitted types of production among certain factories, with a view to further savings in material and labor, but this division of production cannot go beyond certain limits because of transportation problems. As far as metals are concerned, the Reich Board for Iron and Metals has been particularly thorough in reduction of the number of qualities that can be produced, and in the case of aluminum and zinc alloys, which now account for the greater part of German nonferrous metal consumption, as well as scrap metals derived from these metals, the entire German production now consists of comparatively few alloys. The stocks of other alloys cannot be large, but it is likely that substantial quantities of manufactured metals are held in storage at various works. In order to "mobilize" these for armament production, the Reich Minister for Armaments and Munitions has ordered them to be scrapped, even though new and unused, if they cannot be used directly for the production of armaments in the near future. While the standardization has caused some inconvenience it is claimed that it does not weigh heavily compared with the great savings in labor and raw material resulting from the restriction of production to a few types of alloys only. Similar results have been achieved in the manufacture of chemicals for direct consumption. Here also the consumer's choice has been limited to a few carefully selected items, and under prevailing conditions buyers are glad to avail themselves of whatever materials are offered to them. Standardization has also been found the best means of overcoming difficulties resulting from rationing.

The Italian Ministry of Corporations reports that mining activity is being intensified in the entire country. Special attention is devoted to the search for new deposits. The production of solid fuels, gas, oil, and asphalt is said to have increased. There is a surplus of zinc ore, mineral salt, pumice, boric acid, and borax which is being exported. Appreciable progress is claimed in synthetic rubber production and the manufacture of cellwool and artificial fibers. A remarkable output level is said to have been reached in the production of synthetic nitrogen and sodium compounds. Even greater achievements are claimed for the production of synthetic resins. Lead and magnesium are no longer imported, and imports of antimony, tin, and manganese have been reduced. Rather surprisingly, no reference is made to mercury, bauxite, and sulfur, which used to be of considerable export interest before the war. It is known, however, that German interest in Italian bauxite and sulfur has declined considerably because of transport difficulties. Germany prefers to buy bauxite from France and Hungary, while sulfur requirements are largely met by reliance on sulfuric acid from sulfide ores.

Montecatini Employs 80,000

Montecatini, the leading Italian mining and chemical combine, is reported to employ more than 80,000 men in 32 mines and quarries, 18 marble quarries, 143 industrial plants, 14 metallurgical works, 23 power stations, 5 coke and fuel plants, 5 jute spinning mills, and 3 laboratories, the largest of which employs 550 scientific workers.

Methanol Made from Methane

A process for the catalytic conversion of methane into carbon monoxide and hydrogen, which should be useful for both the synthetic production of motor fuel and the manufacture of methanol, has been developed by C. Padovani and A. Lotteri. For the time being the carbon monoxide–hydrogen mixture will be used only for the production of methanol, and even here very great difficulties are being encountered. The principal technical obstacles have occurred in finding suitable catalysts of sufficient thermal resistance, in temperature control, and in the elimination of secondary reactions. The available methane deposits are mostly small, there are no adequate storage facilities, and little is known about the extent of the underground reserves. Apparently the process cannot be carried out economically unless a sufficiently large throughput of methane is assured. The conversion plant may have to be taken down and re-erected elsewhere. It is stated that 1 cubic meter of 95 per cent methane yields approximately 2.5 pounds of 98 to 99 per cent methanol.

Iron Sands Are to Be Exploited

The shortage of iron and steel and the difficulties in the way of imports have awakened interest in the deposits of ferrous sands found on the coast of central Italy, especially in Latium, though in part under the sea. The sands contain about 5 per cent of iron, and can be briquetted to facilitate handling. The briquets are burnt in electric furnaces together with lignite coke. For the production of 1,000 pounds of iron, 1,800 pounds of briquets, 560 pounds of lignite coke, 215 pounds of limestone, and 14 pounds of electrodes are required. The pig iron produced contains 4.01 to 4.40 per cent of carbon, 0.47 to 0.99 per cent of silicon, 0.82 to 1.48 per cent of manganese, and 0.48 to 0.76 per cent of titanium. A plant for a daily production of 600 tons of con-

centrates is to be set up by the Terni company, while the Cogne company has been conducting trials at Aosta.

Turin Company Produces Substitutes for Copper Sulfate

Romianca Società per l'Industria Chimica e Mineraria of Turin is producing substitutes for copper sulfate. It is claimed that encouraging results have been obtained. The manufacturing plant has been adapted to the changed conditions of production in spite of great difficulties.

Shortage of Oil Stimulates Research

The shortage of vegetable oils has given rise to various measures for increasing supplies. All bones must now be sent to factories equipped with facilities for extracting fats with solvents. Extraction by means of water or steam is no longer permitted, and bones which have not been subjected to fat extraction must not be used for fertilizing. A research station has been set up in Rome for investigating the cultivation of oil-yielding trees in the Mediterranean area. In Croacia, tobacco planters have been instructed to pay particular attention to the production of seeds which, it is claimed, would yield 500 tons of oil from an average crop.

The difficulty of obtaining chemical and pharmaceutical products from the usual sources in Continental Europe has stimulated development of the local chemical industry, and frequent reports have come from Spain during recent months of the authorization of new chemical ventures by local companies.

New Chemical Factories Are Authorized in Spain

Little is known about the progress actually made under these authorizations, but it seems that most of these new ventures are concerned with products of daily use which can be easily produced in small apparatus and do not require large investments. Thus the Fabrica Española de Productos Químicos y Farmacéuticos S. A. is to engage in the manufacture of saccharin at its factory at Lamiaco in the province of Viscaya, but the products must be sold exclusively through authorised pharmacists.

New Shale Oil Producer Formed

A new company, Empresa Nacional de Combustibles Liquidos y Lubrificantes S. A., has been formed in Madrid for the production of motor fuel by the distillation of oil shale. The name of the firm indicates that the company also considers entering the field of lubricants.

Asturian Zinc Plant Extended

Real Compañia Asturiana de Minas, the famous Spanish lead-mining company, has greatly extended its smelting plant at Arnao (Oviedo) and will have an annual capacity of 18,000 tons of zinc, including 3,000 tons of 99.9 per cent metal. The former capacity was 7,600 tons. With the new plant the Royal Asturian will be able to supply the entire home demand and still have a small quantity available for export.

The situation in the British chemical industries continues to be characterized by steady employment, an increasing demand for many essential products, and consequent restrictions on nonessential uses. Every week brings new control measures either in home or in foreign trade.

New Control Measures Are Being Instituted

The coal-tar control order has been modified so as to make the treatment, use, and blending of coal-tar products by distillers and importers subject to license. In order to conserve sulfur supplies, users for stoving purposes in the wool textile and hosiery industries will in future require a license. The treatment, use, and consumption of pyrethrum flowerheads and products manufactured therefrom is also subject to license. Importers of essential oils have been informed by the Ministry of Food that the quota system of importation on the basis of previous import values will be discontinued. For the time being import licenses are being issued for essential oils for approved purposes only, and this will be replaced later by a scheme for regulating imports and distribution. Export licenses have been required since November 2 for crucibles, graphite, cellulose nitrate (and products), cinchonidine, cinchonine, nickel compounds, sodium sulfide, water-treatment compositions containing phosphates, insecticides, fungicides, weed-killers, animal dips, disinfectants containing arsenic compounds, chlorinated naphthalenes, cyanides, fluorides, metaldehyde, nicotine, petroleum oils, pyrethrum, resinates, rosin, tall oil, silicofluorides, sulfides or sulfur, lubricating or greasing compositions, mineral jelly and mixtures, oils, fats, and greases and mixtures, and waxes and mixtures. Maximum prices have been fixed by the authorities for citric acid.

Effects of War on Industrial Health

The Chief Inspector of Factories points out in his annual report that despite all wartime influences expected to affect adversely the health of the worker, there is no reason to think that it has been so affected. Moreover, when the increase in the number of persons exposed to risk is taken into account, the incidence of the cases of poisoning is lower than might have been anticipated. The maintenance of health is believed to be largely attributable to the steps taken to provide meals in canteens for the worker at a reasonable cost. No statistical evidence has yet been produced in favor of the wholesale distribution of synthetic vitamins. There is no indication that the work which women have taken up in industry has adversely affected them.

Combination Process for Sulfur Reduction

A committee to make recommendations on the removal of sulfur from coal gas was appointed by the Council of the Institution of Gas Engineers in July 1940 and has now presented its report. Three processes for the reduction of the sulfur content of coal gas to 10 grams per 100 cubic feet are used in Great Britain: the active carbon process, the oil washing process, and the catalytic process. While the two former processes are used in some 25 plants with a total rated capacity of 190,000,000 cubic feet, the catalytic process, though tested on a large working scale over a period of several years, has not yet been installed at more than one works. The committee states that by a combination of the catalytic process with either the active carbon or the oil washing process, the sulfur content can be reduced to about 3 grams per 100 cubic feet. The catalytic process is said to be particularly suitable for treatment of water gas or producer gas, since it is the most effective means of removing carbon oxysulfide, which forms a fairly large proportion of the total organic sulfur contents of such gas, but this has not yet been tried on a commercial scale. As soon as circumstances permit, the Gas Light and Coke Co., which has developed the catalytic process, intends to erect another catalytic process plant to incorporate certain modifications in design resulting from the ex-

perience gained in the successful operation of the present plant. Meanwhile the committee has arrived at the recommendation that at first the organic sulfur compounds in all supplies of town gas should be reduced to 10 grams per 100 cubic feet before distribution to the public. Undertakings should further be encouraged to reduce the sulfur content to 3 grams per 100 cubic feet, and the possibility of the attainment of a still lower limit should be kept under review.

Cellulose Derivatives for Protecting Airscrew Blades

Various processes are now in practical use for the protection of airscrew blades by cellulose materials. The blades may first be protected by a coating of clear cellulose, and plastic cellulose may then be used to seal up any space left after both sides have been covered. The main protection, however, is generally provided by cellulose nitrate or acetate sheets which are attached to blades and made to penetrate the surface of the compressed wood after reduction to a pliable state in a plasticizing bath, or by heating under pressure in an autoclave. There are differences in details between the different processes, but cellulose derivatives have generally assumed considerable importance, for this purpose.

Gas Research Board Investigates Methane Production

If hydrogen under pressure is passed through a bed of coal in which carbonization has just started, a reaction commences between the hydrogen and the coal substance undergoing decomposition whereby methane is produced. E. V. Evans, president of the Institution of Gas Engineers, in a recent speech told of the work carried out in this connection by the Gas Research Board. The amount of heat evolved per pound of carbon when hydrogen is converted to methane is about one fifth of that produced when that carbon is burned in air or oxygen. The methane reaction, therefore, has to be controlled. There are known methods of controlling the reaction, but it is a new technique and the work of taking the laboratory conditions to the next stage of an exploratory small-scale plant is soon to be started. Arrangements for the erection of such a plant have already been made. It is thought that if about half the coal can be converted to methane and a primary tar suitable for hydrogenation, the remaining half, which is more difficult to treat with hydrogen, may be induced to react with steam to produce the hydrogen required in the first stage of the process. It is proposed to add a proportion of oxygen to the steam so that the necessary heat is liberated internally where it is required. The preparation of oxygen is part of the plan, and it is hoped to produce oxygen even more cheaply than is the practice today by taking advantage of the high pressure of the gases leaving the methane reaction vessel.

The Gas Research Board is collaborating with the Fuel Research Board in the synthesis of methane from hydrogen-carbon monoxide mixtures in the presence of a catalyst. Extensive investigations have been carried out on the removal of sulfur compounds from water gas and from coal gas. The information acquired may lead to a simplified method of removing sulfur compounds from normal coal gas.

British Chemical Manufacturers Cooperate with Government Departments

The Association of British Chemical Manufacturers reports in its annual survey that it continued to work in the closest contact with the government departments concerned with the control, supply, and use of chemical products and with the departments operating the import and export licensing procedure. During the year the Board of Trade decided not to reimpose the Key Industries Duty on chemicals hitherto exempted on the grounds of nonmanufacture in Great Britain, even though manufacture might be started on a scale commensurate with the requirements. The new principle is intended to apply only so long as import control by license continues. The Key Industries Duty was abolished for a short list of products which are imported wholly or largely on government account. Changes in the import duties of this kind are for obvious reasons viewed with some apprehension by the association, but it is realized in the British chemical industry that both war and postwar considerations require special measures. The scheme for the manufacture in university laboratories and research institutes of fine chemicals needed in comparatively small quantities, has not been carried out extensively since the British fine chemical industry has been able to supply most of the needs of the country. In order to avoid duplication of production effort, particularly in the heavy and fine chemical sections, members have been asked to keep the association informed of their development plans. Moreover, it is intended to consider the whole structure of the chemical industry and determine whether it is organized to operate on a basis which will give, after the war, the most efficient service to the community at home and a satisfactory contribution to the export trade of the country. Such a survey would include an examination of their position by individual manufacturers and sections of the trade making the same products. A beginning on these lines has been made already in the coal-tar industry where a survey is being made with a view to coordinating policy throughout the industry.

Scientific Workers Favor Industrial Research Cooperation

The Association of Scientific Workers is supporting cooperative methods in industrial production and research. There are complaints that in textile research (e. g., on nonfelting wool), in the manufacture of synthetic substitute products for imported drugs, and in similar fields not all opportunities for an exchange and pooling of knowledge have yet been taken. British chemical manufacturers are also more sympathetic to the idea of cooperative methods than in peacetime. The enforced concentration of production in fewer plants and the amalgamation of smaller firms to larger, and therefore more economical, production units has had the effect of facilitating the exchange of knowledge and pooling of experience. It seems likely that these gains in organization and efficiency will be maintained after the war since the authorities have made it clear that a large measure of control will be retained even when the most urgent reason therefore has disappeared.

Parliament Discusses Methane Experiments

Progress is being made with the use of mines refuse and town sewage, it was stated in answer to a question in the House of Commons. Some local authorities whose sewage digestion plants yield a surplus of this gas are already using it in their vehicles. Certain others are exploring, at the request of the Minister of War Transport, the possibility of installing the necessary equipment, which can now be made available. Experiments in the liquefaction of methane are taking place at one colliery.

Anti-Fire Foam from Horse Chestnuts

Manufacturing chemists have been buying horse chestnuts at a price of 8 s. per cwt. through the Red Cross, reports *Chemical Age*. From this raw material they are making anti-fire foam, as well as glucose. The protein residue is used as a cattle food.

Government to Approve Pest-Control Preparations

An important scheme which may be copied in other spheres of chemical production is being prepared by the Ministry of Agriculture and Fisheries. It

provides that official approval can be given to proprietary insecticides and fungicides for the control of plant pests and diseases. An expert committee has been appointed to advise the ministry on applications from manufacturers for the approval of their products.

Australia Builds Plant for Vitamin Oil Extraction

A NEW plant for the extraction of vitamin oils, particularly vitamins A and D, has been founded in Melbourne by an American firm and a group of Australian businessmen. Fifty per cent of the capital is held by the American firm and the remainder by Australian firms. The value of the present annual production, based upon current world prices, is between $31,900 and $63,800, and productive capacity of the new plant is estimated at 20,000 gallons of oil annually.

Machinery for processing shark livers has been imported for the venture, but many small boats ordinarily used in shark fishing have been diverted to other uses. Output is limited to about 7,000 gallons yearly because of lack of raw materials.

Last year exportation of shark livers was prohibited by the Australian Government, since it was contended that the entire catch was needed at home to replace cod liver oil formerly imported from Norway. Now the government, because of increased overseas needs for Vitamin A units, is permitting shipment of surplus shark liver oil (or about five-sixths of present production) to England and the United States in equal shares.

Sulfur Production Meets Setbacks in Italy

ITALIAN sulfur production during the fiscal year 1940–41 was 7 per cent less than in 1939–40, according to an unofficial report to the Department of Commerce. There were substantial sales of carbon disulfide, but exports of sulfur declined. Therefore total sales of the refineries were smaller.

Subsidies were not received from the government because of a satisfactory financial condition, but the industry has had difficulties with transportation, labor, and raw materials. It is reported that the sulfur mines are to be modernized.

THE Reich chemical authority has issued a decree restricting the production and processing of polyvinyl chloride to firms who were making this material between January 1940 and April 1941, the Department of Commerce reports.

Brazil's Glass Industry Expands

EXPANSION of Brazil's glass industry is receiving fresh impetus from the wartime need of developing substitutes for scarce metals and the difficulty of importing glass products from abroad. This trend is evident in 1941 figures, showing that 13 additional glass factories went into operation. Brazil now has a total of 71 factories.

The increase in the value of the output of the industry rose from $300,000 in 1930 to $6,267,000 in 1940 when employment in the industry totaled 10,183. Although several of the larger factories are equipped with machines, the smaller factories use hand labor exclusively.

Glass factories make containers for beer, soft drinks, milk, medicines, and table glassware of all sorts. There is no flat glass industry for the manufacture of window glass with the exception of one small plant and almost all window glass must be imported from abroad.

Liquid Rosin Produced in Sweden

PRODUCTION of liquid rosin, a by-product in the manufacture of sulfate pulp from pine, has taken an important place in the Swedish chemical industry since the war, the Department of Commerce reports.

A soap is separated from the waste liquor and is then precipitated with sulfuric acid or sodium bisulfate to obtain liquid rosin. The product is a thick, dark brown oil, sometimes cloudy. The resin, usually purified through distillation, is separated into the following approximate fractions: fuel oil, 5 per cent; fatty acids (refined tall oil), 45 per cent; solid rosin, 20 per cent; and pitch, 30 per cent. Quantity and quality vary according to the composition of the crude rosin and the type of distillation.

The products obtained have many uses in industry. Tall oil is used in making hard and soft soaps and is an excellent raw material for producing sulfonated oils of the type used in the textile and linoleum industries. It also produces an oil of the linseed type by esterification with glycerol. When a siccative is added, this oil will dry easily and can be used as a substitute for linseed oil in varnish.

The rosin obtained through distillation produces rosin size. The liquid rosin is used in making asphalt emulsion, core-oil, disinfectants, and sheep and cattle soap. The pitch has many uses, in the manufacfacture of lac varnish and printers ink, and as a substitute for asphalt in road-building. Phytosterine, an alcohol compound generally found in animal fats, is an important ingredient of liquid rosin. It can be obtained in crystalline form and is a valuable agent for refining petroleum jelly and grease. It is also used in medicinal and cosmetic preparations and in the manufacture of marine oil.

Finnish State Monopoly Purchases Alcohol Output

THE Finnish State Alcohol Monopoly has purchased the entire alcohol production of sulfite cellulose factories in Finland for the next five years, according to a report to the Department of Commerce. At the normal rate of production about 40 per cent of the country's motor fuel requirements would be met by these factories. However, because of export difficulties the cellulose output has declined, and this has resulted in a proportionately lower production of alcohol, even though all sulfite cellulose plants are now equipped with apparatus for the recovery of alcohol. It is now planned to produce alcohol direct from wood by a saccharification process.

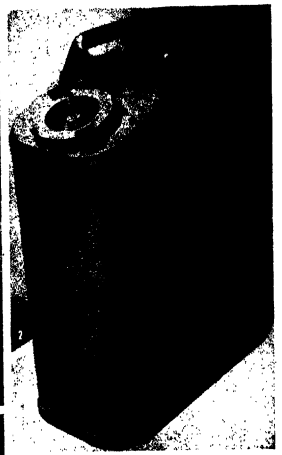
Indian Plant Extends Operations

THE plant of the Lister Antiseptic and Dressings Co., Ltd. (Cossipur, India), has expanded its operations considerably, according to a report to the Government. Recently this firm, deciding to manufacture its own requirements of basic chemicals, added new equipment and began production of ether and carbolic and cresylic acids.

The company formerly limited its output chiefly to surgical dressings, but is now turning out biological products and has installed a distillation plant to make antiseptics.

ITALY is using considerable amounts of aluminum arsenate, lead arsenate, and calcium arsenate to replace copper insecticides rendered scarce by war conditions. Insecticides based on barium fluosilicate and barium polysulfide are being more widely used, and in cases where the use of copper is still considered essential, products containing as little as 1.8 per cent of the metal have been employed successfully, together with adhesives and activators.

A new insecticide of Italian manufacture is based on mercury chlorophenate.



HIJOS de Orbea y Compania of Spain has been authorized to build a plant near Vittoria which will have a daily capacity of 5,000 kg. of sulfuric acid, 3,000 kg. of nitric acid, 1,000 kg. of nitrocellulose, and 1,000 kg. of intermediates for dyestuff, according to an unofficial report to the Commerce Department.

MANITOBA'S 35 plants producing chemicals and allied products almost doubled their output in 1941 as compared with 1940, according to a recent report from the Dominion of Canada. The gross value of 1941 production was $9,215,936, and the combined staff of these factories more than tripled, increasing from 603 to 2321.

New Containers for Old

O. W. I. PHOTOS

1. Fiber cartons replace nail-bound wooden boxes for packing apples. 2. The new army "blitz" can, a five-gallon metal container for water, oil, or gasoline, is constructed with air spaces to prevent sinking. 3. Wartime tobacco containers include one-pound fiber container at left and two-ounce fiber container, center. At right, old two-ounce metal can. 4. Fiber shell containers with metal rims are being experimented with for shells, howitzers, and hand grenades. 5. Old square metal powder container shown beside fiber package. 6. Metal cans at left were introduced by brewers, but beer is back in bottles, as at the right, for the duration. 7. New and old oil cans include, left to right, metal can, fiber container with metal ends, all-fiber container, proposed glass model, and glass container with metal cap.

8. Paint containers shown are one-quart metal can on one-gallon metal can, one-gallon fiber container, two-quart bottle, one-gallon bottle, and pint glass.

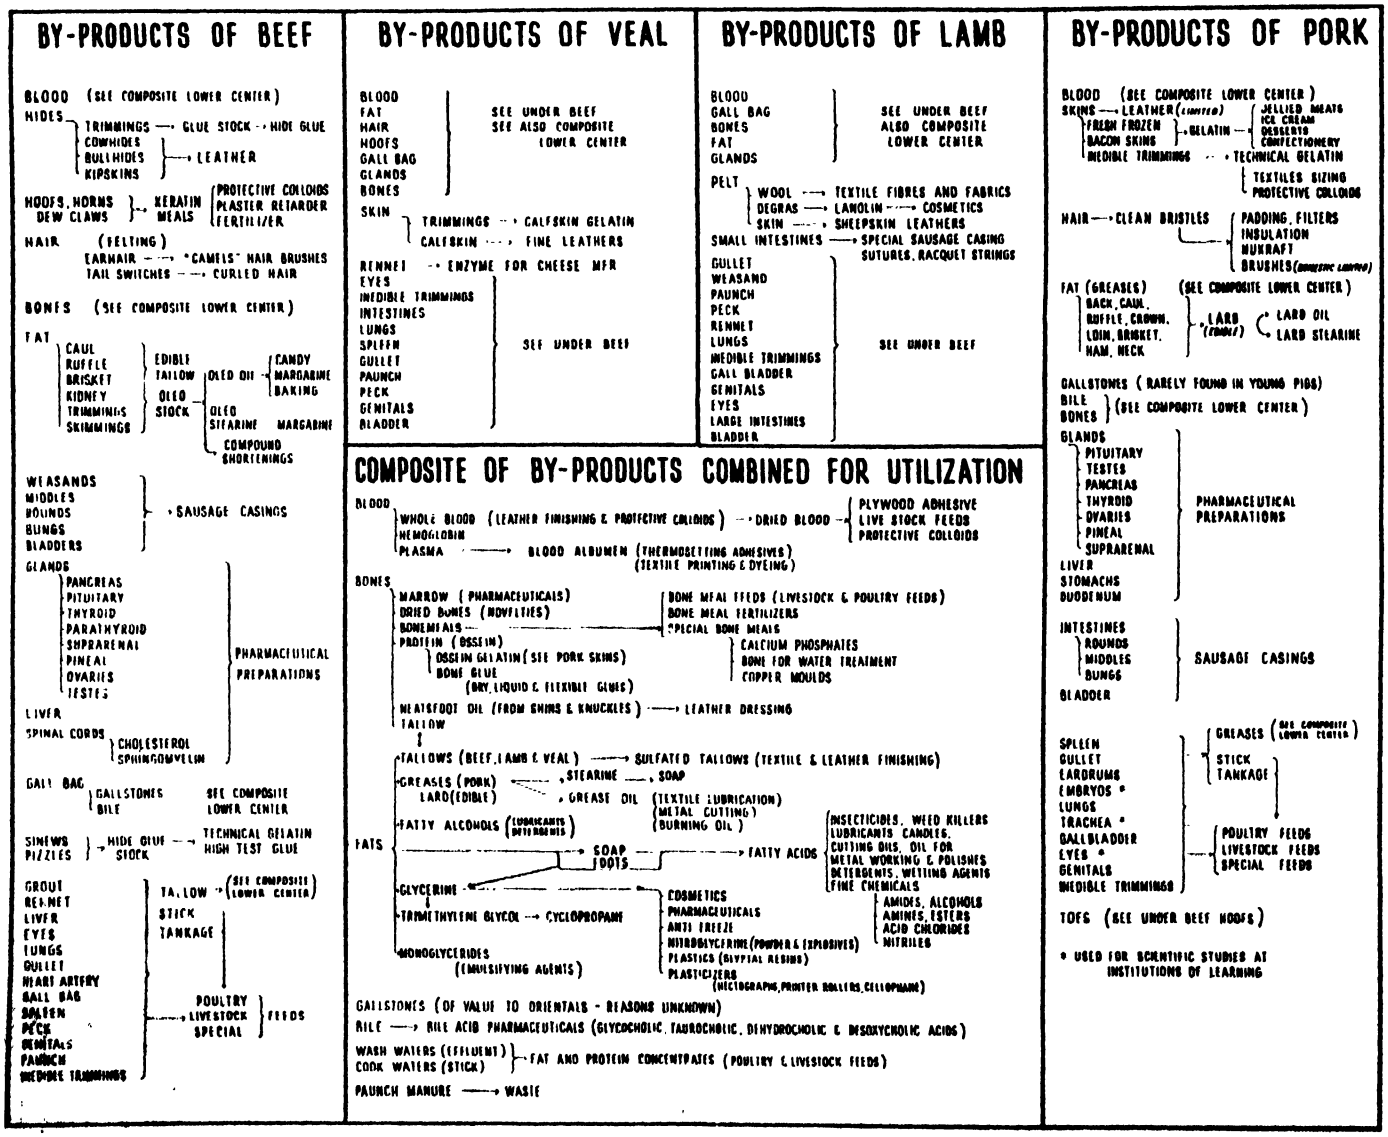
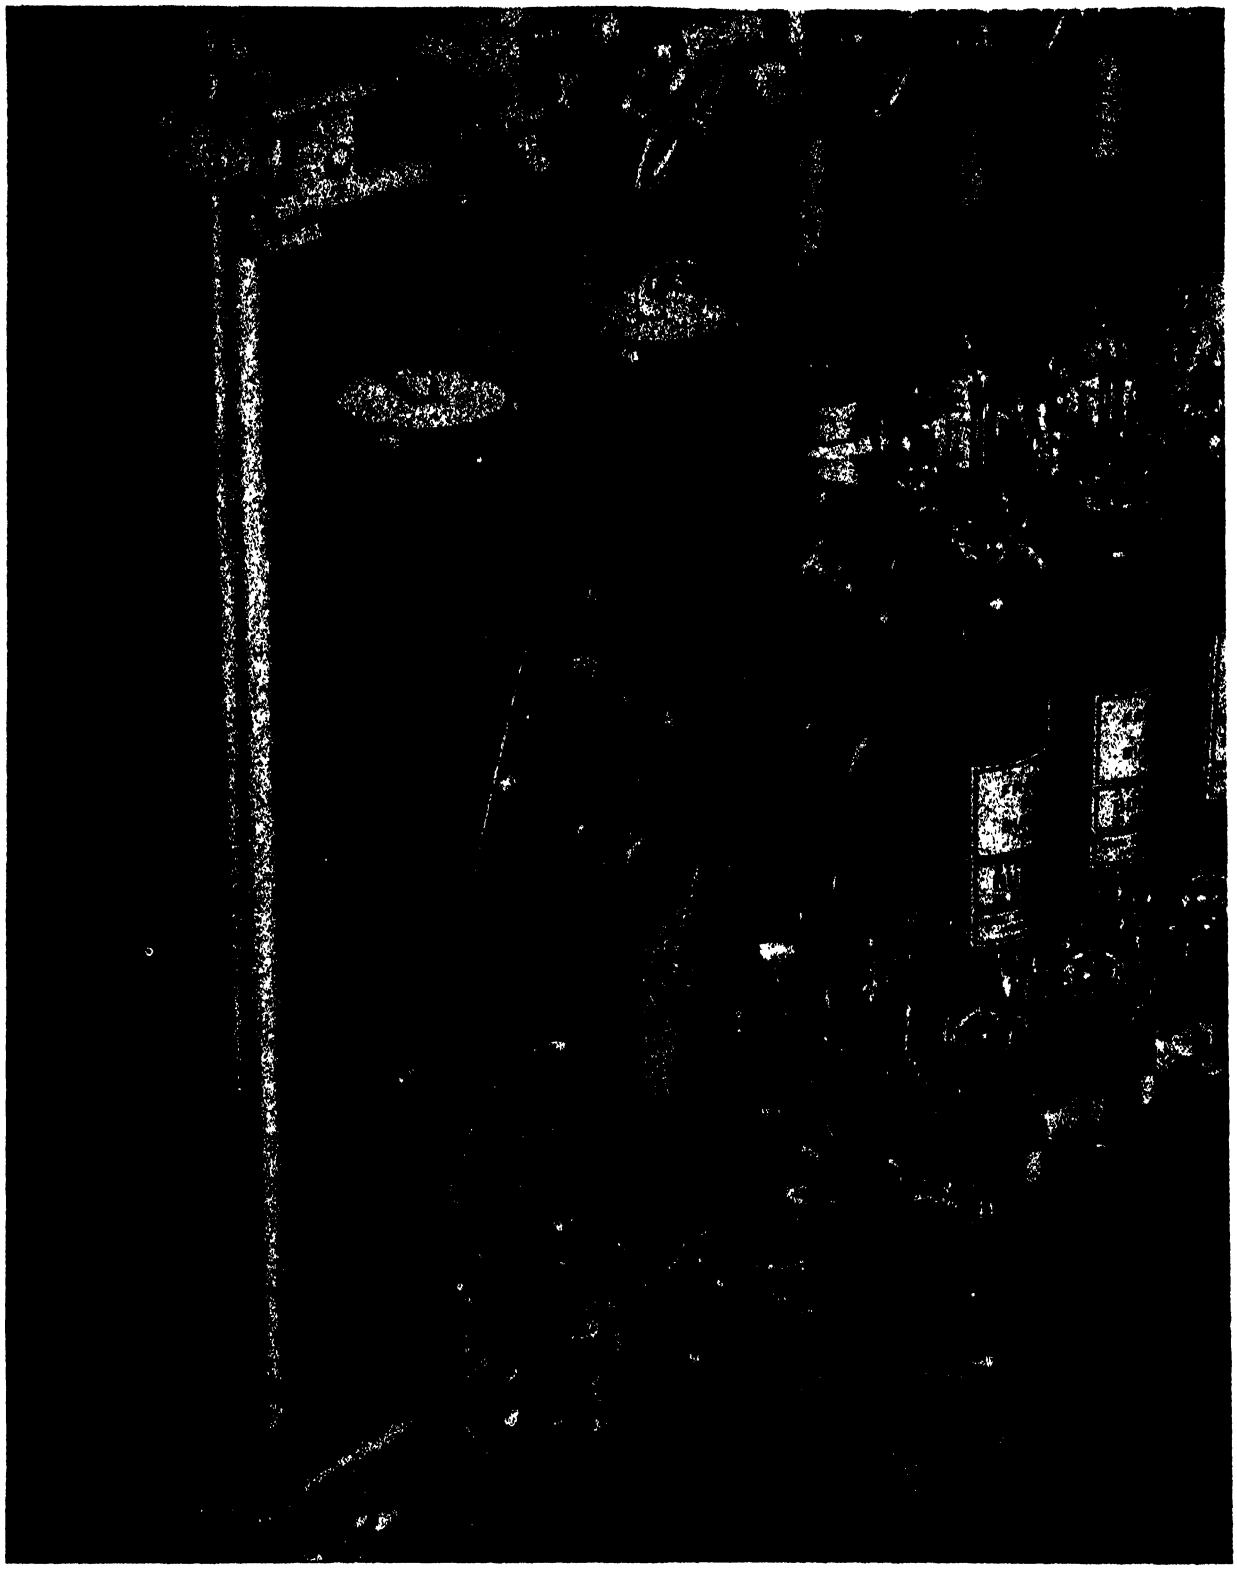
By-Products of the Meat-Packing Industry

H. H. YOUNG, Swift & Co., Chicago, Ill.



MUCH has been written and still more said about the wonders of by-product utilization in the meat-packing industry. Analysis of the data reveals that all these developments are inevitable; they take place automatically. This statement at first rings of heresy, yet it is substantiated by a number of facts.



The meat-packing industry has been responsible to a certain extent for the utilization of its by-products, yet many other industries have contributed substantially to this development. The meat-packing industry was not the first to manufacture lard, soap, glycerol, glue, and gelatin, although it has contributed many improvements and innovations to many, if not all, of these related industries. Other industrial firms not infrequently conduct experimental studies with by-products of the meat-packing industry and in many cases develop new uses for these materials. Such research may be done independently or in cooperation with the laboratories of the meat-packing companies. Cases in point are the development of whole blood as a protective colloid stabilizer for asphalt emulsions and the use of keratin hydrolyzates as plaster retarders.

The important point is that the meat-packing industry has capitalized upon and contributed substantially to by-product recovery and utilization but has not invented it. The coal and coke industry was one of the earliest to promote recovery and utilization of its by-products. So long as necessity shows the proper parental responsibility for invention, we shall find increased utilization of meat-packing by-products—if not within that industry, then within some other. When a product becomes plentiful it becomes cheap, and when cheap enough it is worth while to do research in order to enhance its value. Gelatin from pork skins is one excellent case in point. Conversely, approximately 35 pounds of paunch manure are obtained from every head of cattle and money is spent to discard it as waste; it may offer an interesting reward for any research expended.

The chart lists every by-product for which we have been able to trace the history. The total numbers of items under beef, veal, lamb, and pork are 41, 27, 28, and 31, respectively, a grand total of 127 kinds of by-products derived from dressed livestock. This number is large, but includes eight kinds of beef, veal, and lamb glands, and seven kinds of pork glands—a total of 31 by-products representing

POWELL CORROSION

This distillation system, in the plant of a large manufacturer, is equipped with Powell Flanged End "Y" Valves.

Powell Valves on this distillation apparatus assure dependable flow control in a nationally-known process plant.

For nearly a century Powell has been making valves to satisfy every need of American Industry. Thus through the years, as each new process requiring valve control has been introduced, the Powell Engineering staff has been ready with valves designed to satisfy all demands of the job to be done.

In 1925, anticipating the requirements of the rapidly expanding Chemical and Process Industries, Powell pioneered in the manufacture of an entirely new type of valve—the Corrosion-Resistant Valve.

Today Powell has the most complete line of valves designed to give long, unfailing service in the exacting control of the innumerable corrosive media.

Naturally the Powell Line has been simplified and standardized as much as possible but a considerable diversity of design is necessitated by the limitations of the materials from which the various valves can be produced. However, each valve is designed to meet the requirements of a number of different services.

Shown here are a few examples of the Powell Corrosion-Resistant Line.

Meat-Packing By-Products

CONTINUED FROM PAGE 1660

eight different glands. It becomes evident then, that, when counting the number of by-products, one must choose his basis carefully. To include the very large number of articles which are manufactured from primary by-products of the meat-packing industry would carry the by-product hypothesis beyond comprehension.

Lard, compound shortenings, and margarine are listed as by-products, whereas sausage products are omitted. Glands are listed as one item because they make up a class of raw materials from which the same general type of commodity is manufactured. In other words, the basis preferred is one in which the ultimate usage is the controlling factor. Any definition of by-products is subject to just criticism. Webster defines a by-product as "a secondary or additional product, something produced, as in the course of manufacture, in addition to the principal product". Such a definition precludes the possibility that a by-product might be a principal product—for example, lard, compound shortening, margarine, and soap. For this reason, we prefer the descriptive definition found in the Dictionary of Political Economy: "materials which, in the cultivation or manufacture of any given commodity, remain over—and which possess or can be brought to possess a market value of their own". The dash aptly divides this definition into primary and manufactured by-products. The research involved is denoted by the phrase "brought to possess".

Primary by-products, whether from beef, veal, lamb, or pork, number 28:

Blood	Intestines	Eyes
Hides	Glands	Embryos
Skins	Liver	Lungs
Hoofs	Spinal cord	Gullet
Horns	Bile	Heart artery
Dewclaws	Gallstones	Gall bag
Hair	Sinews	Spleen
Wool	Genitals	Inedible trimmings
Bones	Stomachs	
Fats	Bladder	

Primary by-products may be sold as such to other manufacturers who further process them into useful commodities, or they may be processed by the packer, being converted into secondary or manufactured by-products. These latter are relatively few in number:

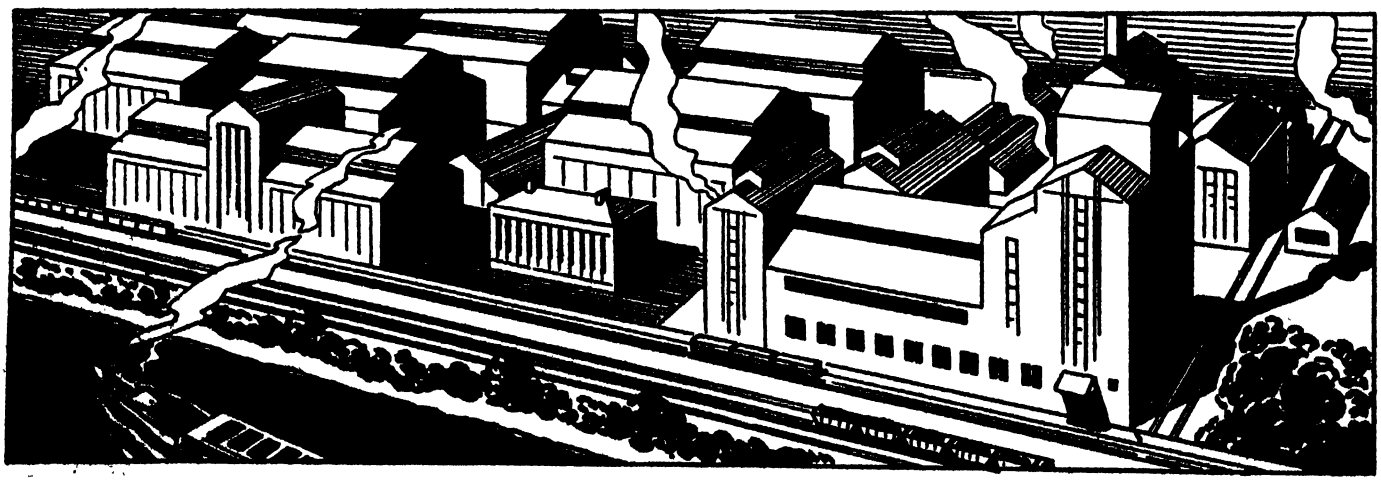
Poultry feeds Livestock feeds Special feeds	from by-products grouped in the lower portion of each column shown in the chart
Soap Grease Glycerol Tallow Lard Compound shortening Margarine Fatty acids	from animal fats and oils
Sausage casings Sutures Strings	from intestines, bungs, and bladders
Blood albumen Hemoglobin Whole dried blood	from liquid whole blood
Pharmaceuticals	from glands, livers, spinal cords, and gall
Keratin meals	from hoofs, hair, horns, dewclaws, and toes
Glue	from bones, hide, and skin trimmings
Gelatin	from skins and bones (ossein)

In the lower center portion of the by-products chart is inserted a composite tabulation. The primary by-products at the left of this composite table are segregated only as to kind—blood, bones, fats, bile, wash waters, cook waters, and paunch manure. These materials are combined for handling, whether derived from beef, veal, lamb, or pork.

The meat-packing industry further processes blood, bones, fats, cook waters, and wash waters into manufactured by-products and these serve as raw materials for still more industries. It is impossible to fix, for example, the number of items made from fats, but the composite chart illustrates the potential ramifications suggested. The concept of tennis racquets, shoes, and bolts or screws as by-products of the meat-packing industry would appear to be somewhat extreme, even though gut, leather, and lard oil, respectively, are used in their manufacture.

The meat-packing industry produces 28 primary by-products, and 29 manufactured by-products or a grand total of 49 by-products.

Industrial Toxins and War Production



MANUFACTURERS using such defense chemicals as toluene and benzene and, for that matter, TNT itself, may well be interested in a report by Harry N. Holmes [*Science*, 96, 384 (1942)].

He contributes evidence from Germany, Britain, and the United States indicating that these substances destroy vitamin C (ascorbic acid) in the bodies of workmen exposed to vapors or to skin contact. Already some organizations give such workmen 100 mg. of vitamin C daily to replace that lost. The results in general health and vigor have been encouraging. Since a lowered level of this vitamin results in weakness, its loss cannot be tolerated in war industries.

G-E Workers Win $115,000 for Suggestions in 10 Months

GENERAL ELECTRIC workers this year have shattered all company records for worthwhile suggestions.

During the first 10 months of 1942, employees were paid $115,000 for 12,250 ideas for saving materials or time in war production. This surpasses by a wide margin the best previous annual mark, $104,000 paid for all suggestions adopted in the full year of 1929.

Old du Pont Powder Wheels Scrapped for War

HUGE iron wheels that ground out gunpowder in the Civil War, and later helped free Cuba and win the First World War, are now to be hurled at the Axis in their final smash for America.

The du Pont company is sending the ponderous old powder wheels of its Eleutherian Mills, founded 140 years ago on historic Brandywine Creek, to the Nation's mounting scrap pile as fast as dynamite can blast them apart.

There are 28 of the old wheels, each weighing 7.5 tons. Fourteen base plates, weighing 10 tons apiece, as well as supporting gudgeons and operating cogs, are to be shipped to waiting steel mills.

Some of the equipment, believed to be the oldest of its kind in America, was installed as early as 1814. A single set of the wheels will be preserved in its original mounting as a memorial to one of the country's first ventures in gunpowder making.

The Eleutherian Mills were abandoned as an operating powder works in 1923, when smokeless powder, used first on a large scale during World War I, pushed black powder out of a leadership it had held for centuries.

Synthetic Rubber in Army Pontons

THE Army Engineers corps now is ordering only pontons or pneumatic floats made of synthetic rubber, it was revealed by Brigadier General Raymond F. Fowler, chief of the supply division, in citing examples of the production speed and ingenuity which won for all Akron workers of the B. F. Goodrich company the Army-Navy "E" award.

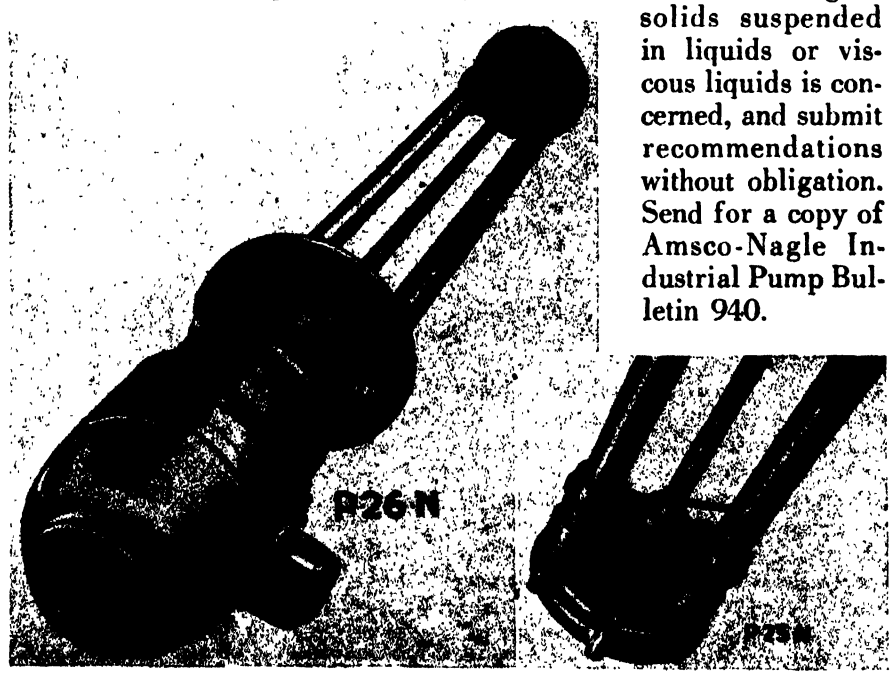
Gen. Fowler told how the company reduced drying time for the floats from 3 days to 3 hours by adopting a kiln-dry method; saved still more time by vulcanizing them instead of cementing; pioneered in the use of synthetic rubber in these huge articles because natural rubber was getting scarce; and "threw open its doors to other manufacturers, permitting them to use these time- and rubber-saving methods.

Who Makes It?

THE following rare chemicals are wanted by The National Registry of Rare Chemicals, Armour Research Foundation, 33rd, Federal and Dearborn Sts., Chicago, Ill.: thiónalide (thioglycolic β-amino naphthalide), ketene, dimethyl acetylene, protocatechuic acid, tribromocaffein, diamino diborane, trimethyl borine amine, indican, 2-desoxyribose, α-tetralone.

Heavily Loaded Liquids *Do Not Faze These Pumps* . . . . . .

While they handle clear liquids, Amsco-Nagle Centrifugal Pumps just as effectively handle heavily loaded liquids. Wide impeller clearance and slipstream impeller design reduce friction and are responsible for the high degree of hydraulic efficiency in both the horizontal and vertical shaft types.



Particularly noteworthy is the performance of Amsco-Nagle vertical shaft pumps. In installations calling for this type of unit, vertical shaft pumps have a chance to prove their efficiency and Amsco-Nagle Pumps have proved their worth on numerous occasions. A 1½" type "SD" dry-pit pump with overall length of 25 ft. and total operating head of 48 ft. is satisfactorily handling sand-laden locomotive boiler makeup water to a settling system, for a western railroad.

Another Amsco-Nagle Pump, a 2" type "SW" wet-pit unit, shown, is performing admirably handling syrup in a raw sugar refining process at a Michigan beet sugar refinery. Like all Amsco wet-pit pumps, it has an inverted inlet. That is, liquid enters the water end from the top. This design eliminates air or gas binding and utilizes hydraulic thrust to counterbalance the weight of the revolving parts.

The supporting structures between water-end and floor plate both have an added purpose; one serves as a discharge pipe and the other serves as a conduit for lubricant to the submerged bearing, which is retained in a split yoke.

This particular pump is equipped with a screen on the entrance side to keep back large lumps of sugar from the dissolver.

Many processing plants have found that Amsco-Nagle Pumps are designed to eliminate pumping problems frequently experienced. The present wartime need for smooth, constant operation suggests their use. We will be glad to review your pumping problems where the handling of solids suspended in liquids or viscous liquids is concerned, and submit recommendations without obligation. Send for a copy of Amsco-Nagle Industrial Pump Bulletin 940.

Sapphire boules made by the Linde Air Products Co. On the left is a 200-carat boule which is typical of present commercial material. The other, a 1943 model and one of the largest yet made, weighs about 350 carats, measures 2 3/4 inches long.

Domestic Synthetic Sapphires

A RELIABLE source of supply for synthetic white sapphires has recently been created by The Linde Air Products Co., a Unit of Union Carbide and Carbon Corp. Until the war, synthetic sapphires and rubies were imported from Europe. With this supply cut off, however, America has had to develop its own sapphire-production facilities. This has now been accomplished to such an extent that the Linde company is producing enough synthetic sapphires to satisfy the war demands of all the United Nations.

Synthetic sapphires are the same as natural sapphires in every respect except color and the method of their formation. The synthetics are made from aluminum oxide powder. To produce gems from this refractory material, it is necessary to melt highly purified powder in an oxygen-hydrogen flame and allow it slowly to solidify in the form of a large single crystal, a process that must be under careful and rigid control at every step. Not only must the high-purity material be fed at an exact rate, but the high temperature must be maintained to an accuracy within only a few degrees. Production problems have been solved so satisfactorily, however, that jewel cutters can be assured of large, flaw-free, and uniform "boules" that are economical to cut and finish.

The synthetics are removed from the furnaces as boules, each the general shape of a cylinder with a rounded end. Their weight usually exceeds 150 carats. White sapphires, which are the desired industrial product, are crystal-clear, being pure aluminum oxide (Al_2O_3). To facilitate cutting, each boule is split longitudinally before shipment. This operation releases locked-up stresses and assures that the material acquires its normal good resistance to shock. As the half-boules are uniform in size and shape, they can be sawed, drilled, and ground by the same established jewel-cutting procedures as employed with irregularly shaped natural stones, but much more economically.

The principal advantages of synthetic corundum for wear-resistant bearings develop from its great hardness. According to Mohs' scale it is next to the diamond in hardness. In turn, the hardness of synthetic white sapphires, as measured by a special technique, indicates that the material is among the hardest of all types of corundum, synthetic or natural. For all practical purposes, the synthetic material is perfect, the flaws being of a microscopic nature. This uniformity of structure is highly desirable on bearing surfaces.

At the present time the boules are under mandatory allocation for distribution to cutters for essential industrial or military uses, such as jewel bearings of chronometers, compasses, electrical, and fire-control or aircraft instruments. In such instruments they are used in the form of ring, V-type, and cup-type bearings.

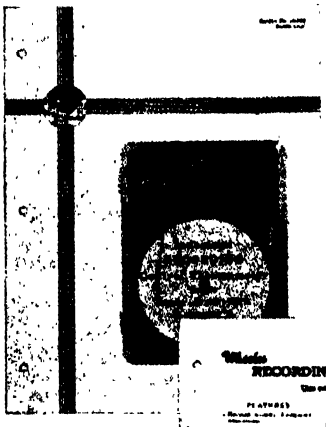
Other uses wherein the gems have been tested and appear to have possibilities are as thread guides in textile manufacturing operations, as orifices for flowmeters and oil-burning equipment, and as insulators in gas-filled or vacuum thermionic devices. Indications are that they are also suitable for use as Diesel engine injector nozzles, as rollers for small needle bearings, and for brazed-tip metal cutting tools, particularly for taking light finishing cuts on metals such as brass, aluminum, and magnesium.

Engineering College Research Association Formed

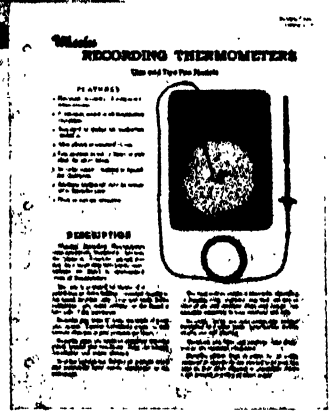
THE formation of the Engineering College Research Association by 73 engineering colleges from all parts of the country to cooperate with the war agencies of the Government and with war industry in the prosecution and promotion of research needed for the war effort has been announced.

Headed by W. R. Woolrich, College of Engineering, University of Texas, the council of the association held its first meeting in Washington, November 27. A close degree of liaison between the Office of Production Research and Development and other governmental and private agencies dealing with wartime research will be maintained by the association in an effort to utilize to the fullest possible degree the vast research facilities of the engineering colleges of the nation.

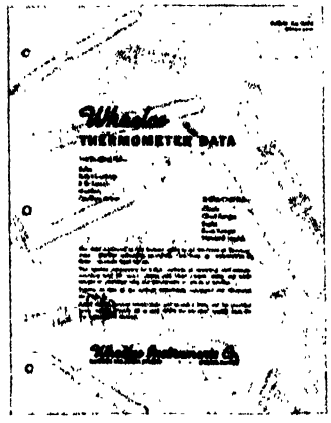
The association will coordinate the research activities of the engineering college laboratories and personnel for the task of conducting vital studies affecting war materials and production.



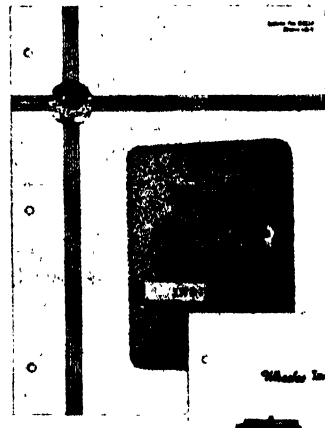
In addition to Dean Woolrich other officers are: Earle B. Norris, Virginia Polytechnic Institute, first vice president; C. C. Williams, Lehigh University, second vice president; R. L. Spencer, University of Delaware, treasurer; Ivan C. Crawford, University of Michigan; Thorndike Saville, New York University; Samuel B. Morris, Stanford University; F. M. Dawson, University of Iowa; N. A. Christensen, Colorado State College; and G. M. Butler, University of Arizona, council.



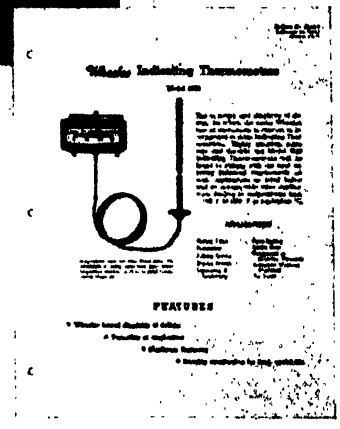
These BULLETINS *tell you*



How to Select . . .



THE RIGHT THERMOMETER

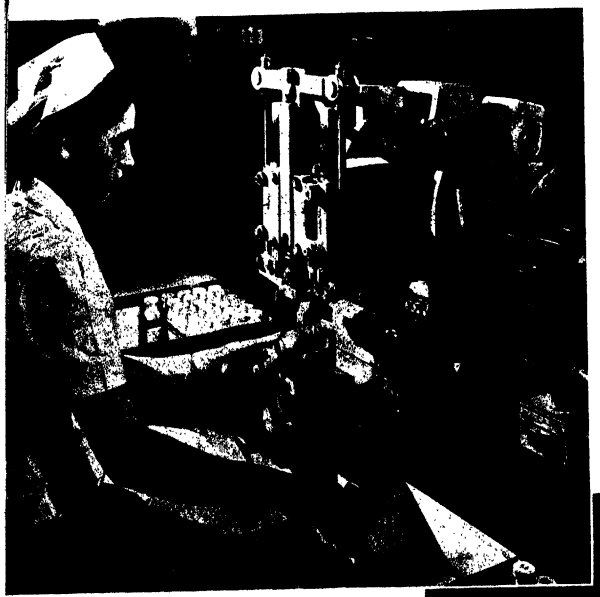


for your Process

Selection of the correct Thermometer for your specific application is as vital as your choice of process equipment, if maximum production is to be obtained.

Wheelco has published five new bulletins, which illustrate and describe various types of Thermometers and explain their function in relation to their intended applications.

You will find a wealth of information in these Bulletins on Indicating Thermometers, Indicating Therm-otrols (Indicating, "Electronic Principle" Thermometer Controllers), Recording Thermometers and Recording Therm-otrols (Recording, "Electronic Principle" Thermometer Controllers), all of which are available in ranges from —100°F. to +1000°F., or —70°C. to +550°C. Also illustrated and described are Thermometer Bulbs, Bulb Sockets, Capillary, Capillary Armor, Charts, Chart Ranges, Scale Ranges, etc. Explanation of how the Flame-otrol (combustion safeguard), Purging Timers, Program Control and Proportioning Control can be integrally incorporated in the various Thermometers is given.



Write for any one, or all, of these Bulletins without obligation.

CHEMICAL NEWS PARADE

Above. Exterior view of the new laboratories of G. D. Searle & Co., Chicago, Ill., where pharmaceutical research is carried on. Incoming materials are routed to the huge pharmacy in the heart of the building, where samples of each are taken by the analytical department to be investigated for purity and identity before they are labeled.

Left. Girl applies labels by machine to approved lots, thereby releasing them for use. They are measured out with extreme accuracy for assembling, granulating, drying, tableting, coating, and similar processes. Each individual label is printed in the Searle print shop, then hand-inspected, and finally, stamped with both batch and assay number.

Below. Rotary tablet press produces more than 500 tablets per minute. Precise inventory methods check weight and accuracy.

Above. Clinical research includes such activities as grinding purified psyllium seed. This machine automatically classifies the particles as to size. Those which are too small are thrown away; those which are too large are separated for regrinding.

Left. A glandular extraction unit has been set up in one section of the new laboratories. Because of the labile nature of the hormones every operation is conducted at or near the freezing point. In this way the full activity of the gland may be retained.

Right. An operator examines ampul solution under the brilliant light and against white and black backgrounds, which will reveal the tiniest of suspended particles. Confirmation of sterility is a separate test. Ampuls must be both air-tight and water-tight, therefore the autoclave and blue bath are used. The ampul department, which is composed of glass-walled passageways and rooms, has its own individual air-condition system, as well as dust-removal, humidity-control, and sterilization units.

Conference on War Service

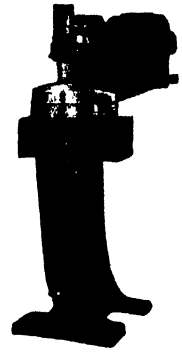
THE Association of Consulting Chemists and Chemical Engineers, Inc., held a dinner meeting on December 7, 1942, at the Electrical Testing Laboratories, Inc., New York, N. Y. The purpose of the meeting was a "Conference on War Service" by independent consulting chemists and chemical engineers and privately owned laboratories. Besides a fully represented membership and their invited guests there were present representatives of the Chemical Warfare Service and Ordnance Department, Services of Supplies, U. S. Army; Bureau of Ships, Bureau of Supplies, and Accounts and Navy Purchasing Office, U. S. Navy; and representatives of the War Production Board. The technical press was also present by invitation.

Copies of the association's Directory of Members, setting forth in detail their qualifications and specialties, were given guests to assist them in securing expert consultants. Copies are available on request to the association, 50 East 41st St., New York, N. Y.

Foundation for Pharmaceutical Education

THE American Foundation for Pharmaceutical Education was incorporated in the State of New York in August. The organization meeting was held October 1, at which time the following officers were elected: president, Ernest Little; vice president, Charles S. Beardsley; secretary, E. L. Newcomb; treasurer, S. B. Penick; executive committee, Hugh P. Beirne, Harry Noonan, and Robert L. Swain.

The purpose of the foundation is to receive, administer, and allocate a fund, or gifts, to improve and broaden the profession of pharmacy through educational processes. It will uphold and improve pharmaceutical education by aiding and strengthening colleges of pharmacy through appropriate means to provide an adequate, well trained, and reliable personnel for retail pharmacies and to furnish technically and scientifically trained personnel to the pharmaceutical industry and allied manufacturing concerns, hospitals, college faculties, and other professional fields.

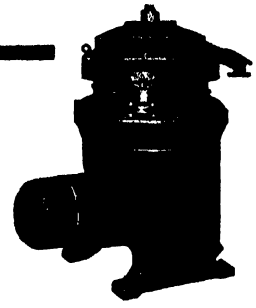


Army-Navy E Awards

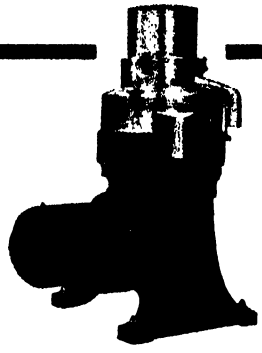
RECENT recipients of the Army-Navy E Award include the Owens-Corning Fiberglas Corp., Toledo, Ohio, the B. F. Goodrich Co., Akron Ohio, and the Jessop Steel Co., Washington, Penna.

The Chemical Industry requires a wide variety of centrifugal machines to accomplish its various purposes.

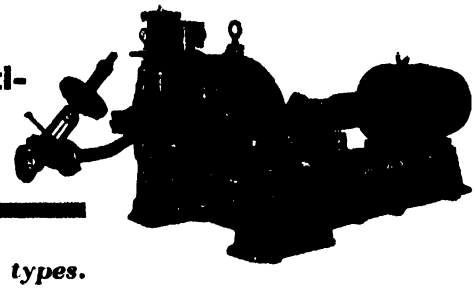
Here are the general types of centrifuges



SHARPLES PRODUCES



1 **The tubular solid bowl "Super-Centrifuge." Highest centrifugal force commercially produced. Clarifiers. Separators.**



2 **The disc type bowl. Lower speed, large volume, largest capacity, clarifiers, separators.**

3 **The valve type bowl. Clarifiers and separators. Discharges solids as a cake automatically at full speed.**

4 **The nozzle type bowl. Clarifiers and Separators. Discharges solids as wet slurry continuously at full speed.**

5 **The extractor type bowl. A crystal dryer. Automatically loads, rinses, dries and discharges crystals.**

We would be glad to send full information on any of these types.

THE CARVER LABORATORY PRESS

QUICK, ACCURATE TESTS AT MINIMUM EXPENSE

For Research—for testing, for the production of samples, and for small output operations—the Carver Laboratory Press is known and used throughout the world.

Powerful, inexpensive, compact—and standardized with complete accessories for various uses or General Research as desired.

Load range of standard press from 0 to 10 tons. Also 20-ton size available on order, and special large accurate gauges for low pressure work when required.

Write for complete catalog.

FRED S. CARVER
HYDRAULIC EQUIPMENT
244 HUDSON ST., NEW YORK

TAPPI Bulletin

THE Technical Association of the Pulp and Paper Industry, 122 East 42nd St., New York, N. Y., has issued No. 1 of the Tappi Bulletin, devoted to the war effort of the pulp and paper industry. The following fields are to be covered:

Problems or projects coming to the attention of the paper industry and not specifically covered by bulletins from the War Products Development Section, Pulp and Paper Branch, War Production Board.

Methods of testing or evaluating properties of various products.

Descriptions of materials that may be used in paper products to give them specialized properties.

Abstracts of articles from magazines and trade journals.

Question and answer section.

Arno W. Nickerson is to work with R. G. Macdonald, secretary of the association, in the collection and dissemination of this material. Nonmembers of the association may subscribe to the service at $5.00 per year.

Heating Your Home in Wartime

THE Minnesota Resources Commission, State Capitol, St. Paul, Minn., has issued a 32-page booklet entitled "Heating Your Home in Wartime for Comfort, Economy, Health". This was prepared by the Scientific Advisory Committee to Minnesota War Industries, and is available without charge from the commission.

Storage of Butadiene, Isobutylene, Styrene, and Acrylonitrile

REPRINTS of an article entitled "Storage and Handling of Butadiene, Isobutylene, Styrene, and Acrylonitrile", by J. B. Garner, Ludwig Adams, and Robert M. Stuchell, are available without charge from the Mellon Institute of Industrial Research, Pittsburgh, Penna.

Du Pont at War

THE *Du Pont Magazine* in its 140th anniversay number, for August-September-October 1942, gives 36 pages, with numerous illustrations, to the story of the role chemistry is playing in the war effort, and the contribution of du Pont employees to war and civilian needs.

Proceedings of the Photoelasticity Conference

THE Proceedings of the Fourteenth Semiannual Eastern Photoelasticity Conference are now available from E. O. Waters, Room 111, Winchester Hall, Yale University, New Haven, Conn., at $1.50 per copy.

Grading of Mica

A NEW and more efficient process for sorting small flake mica, an essential ingredient in much of the electrical equipment being manufactured for the Nation's armed forces, has been developed by Bureau of Mines engineers and is available to commercial producers. The method already has produced test batches of closely graded mica flakes which were used by a large commercial manufacturer of electrical equipment in producing radio parts. The process is known as electrostatic grading.

Details are explained in Report of Investigations 3662, "Lamellar Grading of Powdered Mica", by Oliver C. Ralston and Foster Fraas which may be obtained free of charge from the Bureau of Mines, Department of the Interior, Washington, D. C.

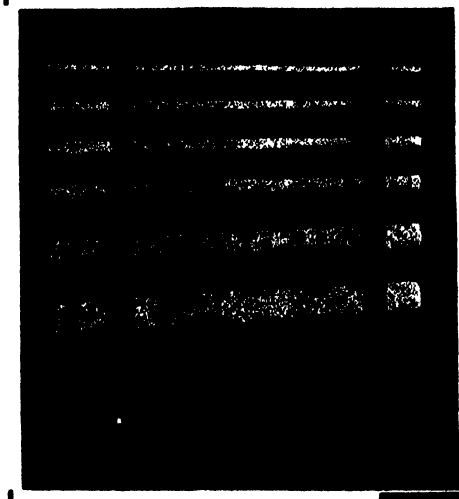
A. S. T. M. Standard Specifications

THROUGH action of its Committee E-10 on Standards, the American Society for Testing Materials has recently issued some 32 new standard specifications and test methods on thermal insulating materials, paints, plastics, and malleable iron. Of these, 13 are emergency specifications and tests designed to expedite procurement or conservation of critical or strategic materials. All of these new specifications are being printed in separate pamphlet form (the emergency specifications on pink stock) and copies can be obtained at 25 cents each from A. S. T. M. Headquarters, 260 South Broad St., Philadelphia, Penna. They will also be bound in the 1942 A. S. T. M. Book of Standards now in preparation.

Saving Coal in Household Heating

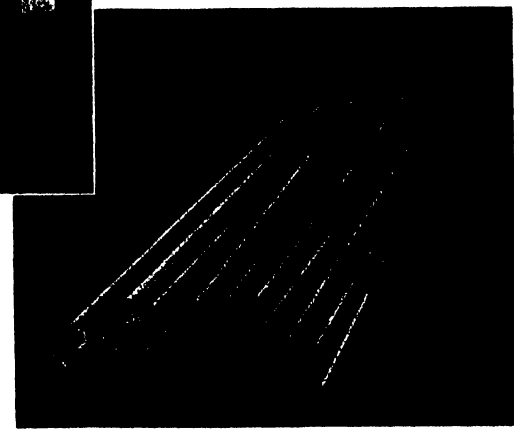
PRACTICAL and timely advice on how to save coal in household heating is offered in a new circular compiled by the Bureau of Mines, "How to Save Fuel at Home", by J. F. Barkley, chief of the Division of Solid Fuels Utilisation for War. Copies may be obtained free of charge by writing to the Bureau of Mines, Washington, D. C., for Information Circular 7229.

Wages as Cost and as Market



A 44-PAGE booklet entitled "Wages as Cost and as Market", Chapter IX of the forthcoming book "Price-Making in a Democracy" has been issued by the Brookings Institution, Washington, D. C. This is pamphlet No. 44, by Edwin G. Nourse, and is sold at 25 cents a copy.

VITREOSIL



(VITREOUS SILICA)

DRAWN TUBING AND RODS

for exacting technical applications

CIRCULAR
AND SPECIAL
CROSS-SECTIONS

OPAQUE
TRANSLUCENT
TRANSPARENT

Vitreosil Tubing and Rod is produced in four qualities, identical in chemical characteristics and similar in most physical properties.

Transparent Vitreosil is fused pure rock crystal and is highly transparent to ultraviolet light; Satin Surface Vitreosil is translucent; Glazed Vitreosil is opaque and smooth surfaced while Sand Surface Vitreosil is opaque and has a rough exterior.

The melting point and co-efficient of expansion are all identical and it is often economical to incorporate various grades of Vitreosil in the fabrication of tubular apparatus with varying optical requirements.

Notice these outstanding characteristics:

Chemical and Catalytic Inertness
Resistance to Extreme Thermal Shock
Impermeability Insolubility in Water
Freedom from Metallic Impurities
High Critical Temperatures
Constancy of Volume and Weight
Unusual Electrical Resistivity
Excellent Thermal Conductivity
Best Ultra-Violet Transmission (in transparent quality)
Homogeneity and Constancy of Physical and Chemical Properties

Vitreosil gives long service in continuous use at varying temperatures up to 1000–1100° C.

NECROLOGY

Frederick M. Becket

FREDERICK M. BECKET, a consultant to the Union Carbide and Carbon Corp., died December 1 at New York, N. Y. He was formerly president of Union Carbide and Carbon Research Laboratories, Inc., and former vice president of Union Carbide Co., Electro Metallurgical Co., and Haynes Stellite Co., all units of Union Carbide and Carbon Corp.

Dr. Becket was born in Montreal, Canada, in 1875. He attended McGill University, graduating with a bachelor of science degree in 1895, and received a master of arts degree from Columbia University in 1899.

Dr. Becket was a pioneer in the electrometallurgical industry. In 1924 he received the Perkin Medal. He was president in 1926 of The Electrochemical Society, was elected an honorary member in 1934, and in 1937 received the society's Acheson Medal Award. He is also a past president of the American Institute of Mining and Metallurgical Engineers (1933) and of The Chemists' Club (1939). In 1940, the Franklin Institute presented Dr. Becket with the Elliott Cresson Medal. In 1940 he received one of the Modern Pioneers Awards of the National Association of Manufacturers. In 1929 Columbia University bestowed upon him the honorary degree of doctor of sciences, and in 1934 McGill University conferred upon him the honorary degree of doctor of laws. For many years, he has been a contributor to technical publications in the chemical and metallurgical fields.

Shortly after the turn of the century Dr. Becket originated and commercialized the fundamental principle of producing low-carbon ferroalloys and alloying metals by reducing ores in the electric furnace with silicon instead of carbon. Although such products had earlier been made by reduction with aluminum, the more costly aluminothermic method was discontinuous and accordingly not appropriate to large-scale production. In his hands, silicon reduction yielded the first electric-furnace ferrovanadium produced in this country, and probably in the world; ferrotungsten of commercial quality from the high-phosphorus domestic ores; ferromolybdenum direct from the natural sulfide; and low-carbon ferrochromium. It was in 1918 that he developed the electric-furnace technique of producing ferrozirconium, used at that time for light armor plate, and now widely employed for improving quality steels.

Dr. Becket early applied silicon reduction to the electric-furnace production of chromium and manganese metals, almost free from iron and thus suitable for many alloys based on copper and nickel. His efforts also led to the tonnage production of silicon metal, a prime factor in the strong alloys of aluminum so necessary to aviation.

Dr. Becket early joined steel makers in the pioneer domestic promotion and development of vanadium and molybdenum engineering steels; he projected the high-chromium steels and irons; to the chromium-nickel stainless steels he contributed stabilization with ferrocolumbium; and for the joining of steels, irons, and copper alloys, he devised welding rods of correct metallurgical properties.

Dr. Becket was a fellow of the American Association for the Advancement of Science, a member of the American Institute of Mining and Metallurgical Engineers, AMERICAN CHEMICAL SOCIETY since 1902, Electrochemical Society, Mining and Metallurgical Society of America, American Society for Metals, Iron and Steel Institute of London, American Institute of Chemical Engineers, and New York Academy of Sciences.

Archie W. Bray

ARCHIE W. BRAY, head of the Department of Biology, Rensselaer Polytechnic Institute, died in Troy, N. Y., on November 18 at the age of 59. He had been a member of the faculty for 17 years. He was known for research dealing with the thymus gland, ultrashort wave therapy, and vocational guidance, and had also investigated the biological methods for the detection of chemical warfare gases and their effects and the fouling of ship bottoms by marine growth.

Bennet B. Bristol

BENNET B. BRISTOL, who with his brother Edgar H. Bristol founded the Industrial Instrument Co., in 1908, which later became The Foxboro Co., died at his summer home at Falmouth Heights, Mass., on November 10. Mr. Bristol was born in Naugatuck, Conn., May 3, 1868. In 1893 he was graduated, M.E., from the Stevens Institute of Technology. Throughout the history of The Foxboro Co., he served as its treasurer and clerk.

William S. Farish

WILLIAM S. FARISH, president and executive head of the Standard Oil Co. of New Jersey, died November 29 at the age of 61. Mr. Farish was a pioneer in the oil industry, organizer and president of the American Petroleum Institute, and since 1933 head of the Standard Oil Co. of New Jersey.

Charles W. Frederick

CHARLES W. FREDERICK, pioneer in the design of aerial photography lenses and nonsilica optical glass, died in Rochester, N. Y., November 29, at the age of 72. Mr. Frederick was designer of aerial lenses used for military photography during the first World War, and during the past three years had evolved a new type of lens now used by our armed forces. His study of nonsilica glass led to the development by the Eastman Kodak Co. of the first new optical glass discovered since the 1880's.

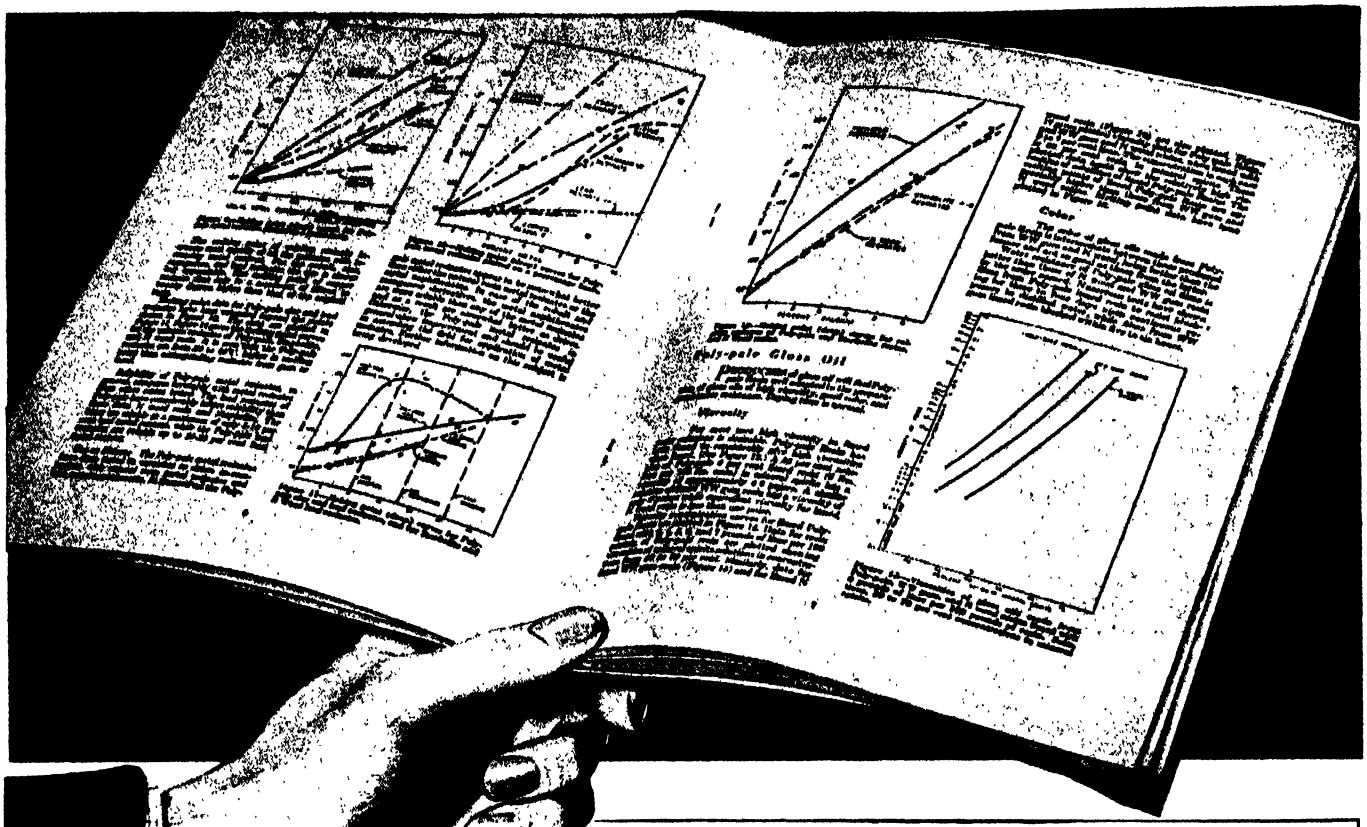
A. B. Gerber

A. B. GERBER, chief chemist of the Trenton, Mich., plant of the Monsanto Chemical Co., died November 22. He was 50 years old.

After receiving a degree in chemical engineering from Purdue University, Mr. Gerber joined the Anniston, Ala., Ordnance Works as a chemist in 1918 and remained as chief chemist after the plant was taken over successively by the Southern Manganese Corp., Swann Chemical Co., and Monsanto. He was transferred to the Trenton plant in the spring of 1942.

Cornelius Magee

CORNELIUS MAGEE, for 27 years foreman of the rubber department of A. Schrader's Son Division of the Scovill Mfg. Co., died August 29 at the age of 66. Mr. Magee had been engaged in rubber manufacturing for 47 years and was one of the founders of the Corning Rubber Co., Brooklyn, N. Y.



Stephen S. Krayer

STEPHEN S. KRAYER, head of the Krayer Chemical Co., died November 27 in Elizabeth, N. J., at the age of 72. Mr. Krayer was born in Germany and was graduated from Heidelberg University. He had resided in Elizabeth 51 years.

Oliver C. Martin

OLIVER C. MARTIN, metallurgist, died November 17 at Plainfield, N. J., at

Wide Solubility • High Viscosity • High-Melting

POLY-PALE RESIN

Solvents for Poly-pale Resin* include hydrocarbons, alcohols, ethers, ketones, esters, and chlorinated hydrocarbons. Solutions are considerably higher in viscosity than equal concentrations of ordinary rosin. The viscosity of 60 per cent solution in Tollac, for example, is 25 centipoises.

The melting point of Poly-pale Resin, 100°C., is 15 to 20°C. higher than for gum or wood rosins.

Poly-pale Resin does not crystallize in solution as ordinary rosin frequently does.

Most important, Poly-pale Resin is available in quantity—and it is inexpensive. It sells for only a slight premium (½¢ for the WG grade, ¼¢ for the N grade) over the palest grades of regular rosin.

A revised 2nd edition of the booklet, "Poly-pale Resin," gives detailed chemical and physical properties and discusses many applications. Mail the coupon for your copy.

the age of 68. In 1908 Mr. Martin worked for the American Smelting and Refining Co. in Denver, and from 1914 to 1923 was manager of the Nichols Copper Corp. plant at Laurel Hill, L. I. He then returned to the American Smelting & Refining Co. as manager of the Perth Amboy plant. In 1925 he went to Belgium, where he was commissioned by the Société Générale de Belgique to build and develop the copper industry. In 1932 he returned to the United States, joined the Phelps Dodge Refining Corp., and in 1936 was sent to manage its plant at El Paso, Tex. He retired in 1940. In 1931 he was given an honorary degree of LL.D. for achievements in the copper industry.

Harry J. Schnell

HARRY J. SCHNELL, president of the Schnell Publishing Co., died November 29 at the age of 67.

At the age of 15 Mr. Schnell went to work for William O. Allison, publisher of the *Oil, Paint and Drug Reporter*, became general manager before Mr. Allison's death in 1925, and as executor of his estate continued the publications. In 1941 he organized the Schnell Publishing Co. Mr. Schnell was a trustee of the New Jersey College of Pharmacy, former president of the Drug and Chemical Club of New York, and of the New York Paint, Varnish, and Lacquer Association.

FLUORESCENT BALANCE LAMP

Directed Frontal Illumination

Mounted at the front of the balance case, the *parabolic reflector* directs all light over the entire working area of the balance.

The lamp is rigidly supported by a clamp which cannot mar the case finish, can be attached to all makes and styles of balances, and when in position permits free movement of the sliding door. The weight of the reflector is greatly reduced by making a separate unit of the auxiliary so that it can be placed on the laboratory bench close to the balance.

The G. E. fluorescent tube supplied with the lamp produces approximately 750 hours of glareless, efficient light of daylight quality.

S-3820 Balance Lamp, Fluorescent, Sargent. Complete with No. S-44285, T-5 fluorescent tube $11.50

S-44285 Fluorescent Tube, T-5, 8 watts. For replacement. Each $1.10

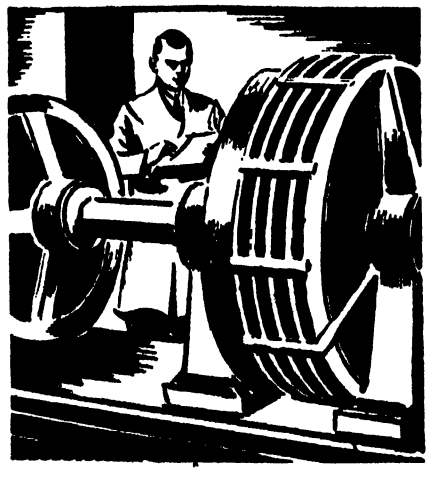
Paul B. Seydel

PAUL B. SEYDEL, founder and senior partner of Seydel-Woolley and Co., died October 20, 1942, in Atlanta, Ga.



Dr. Seydel was born in Belgium, January 22, 1884, and received his doctorate in chemistry from the University of Brussels in 1904. He had been active in the Georgia Section of the AMERICAN CHEMICAL SOCIETY, which he joined in 1905, serving as Local Section Chairman and Councilor. At the time of the Atlanta meeting of the AMERICAN CHEMICAL SOCIETY in 1930, he was chairman of the Publicity Committee.

George L. Teller

GEORGE L. TELLER, president of the Columbus Laboratories, Chicago, Ill., died November 13 at the age of 75. Mr. Teller had been associated with the laboratories since 1902 and had been its president since 1926. He had been a member of the AMERICAN CHEMICAL SOCIETY since 1908.

Edward P. Thompson

EDWARD P. THOMPSON, patent attorney, died November 3 at Elizabeth, N. J., at the age of 86. Mr. Thompson was a graduate of the Stevens Institute of Technology, author of "The Science of Invention" and "Roentgen Rays", and had been instructor in chemistry at the Pingrey School. He was associated with W. P. Stanley, Jr., in the invention of an early electric lamp, developed in the laboratory of Thomas A. Edison, and sold to the Westinghouse Co.

Specific Heats of Gases

THE Specific Heats of Certain Gases Over Wide Ranges of Pressures and Temperatures" is the title of Bulletin 30, by Frank O. Ellenwood, Nicholas Kulik, and Norman R. Gay, Cornell University Engineering Experiment Station. The gases are air, carbon dioxide, carbon monoxide, ethylene, hydrogen, methane, nitrogen, and oxygen; the temperature range is from 0° to 4,000° F.; and the pressure range is from 0 to 10,000 pounds per square inch.

This bulletin gives the general equations which determine the effect of pressure on the specific heats of the gases, within ranges of temperature and pressure encountered most frequently in engineering practice. For the gases considered in this paper, the variations of specific heats with temperature and pressure are also shown graphically.

Single copies may be secured without charge by writing to the Engineering Experiment Station, Cornell University, Ithaca, N. Y. The price for additional copies sent to the same person is 50 cents.

Report on Naval Stores

THE 1942 Semiannual Naval Stores report on production, distribution, consumption, and stocks of turpentine and rosin of the United States by crop years, April 1, 1942, to September 30, 1942, has recently been issued as an 11-page mimeographed report. It was compiled by C. F. Speh and M. C. Lawrence, of the Naval Stores, Research Division, Bureau of Agricultural Chemistry and Engineering, U. S. Department of Agriculture, Washington, D. C.

Coal Miners' Safety Manual

THE Bureau of Mines has published the "Coal Miners' Safety Manual", a 218-page book dedicated to the promotion of safety among the men who work in the 14,000 coal mines of the United States.

Copies may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C., at 25 cents each.

Sweden Industrial Progress

A BOOKLET entitled "Industrial Progress in Sweden", by Ingvar Svennilson and Erland Waldenström, has been published by the Swedish Institute of Industrial Research, Stockholm, established under the auspices of the Federation of Swedish Industries for research into questions relating to industrial economics.

KEEP 'EM FLOWING!

We refer to the vapors being removed from thousands of Condensers and Processing Vessels by Croll-Reynolds Steam Jet Evactors. Production Equipment for this apparatus is being pushed to keep up with what seems to be an ever-increasing demand. Now, even more than ever, we are eager to help the operators of the many thousands of Croll-Reynolds Evactors get the maximum performance from existing equipment.

In some cases vacuum can be increased by merely changing the nozzles. Capacity can often be increased by changing the nozzles and throats or by re-machining them. It is our policy to keep in stock rough castings for throats and suitable materials for nozzles which can be promptly machined for individual conditions on prevailing priorities. Complete new Evactors for vacuum to a small fraction of 1 mm. are still being made subject to crowded conditions on ordnance equipment.

OUTSTANDING TOOLS
for the Chemist —

CONDENSED CHEMICAL DICTIONARY *THIRD EDITION*
Francis M. Turner, Editorial Director. . . . completely revised and enlarged . . . under supervision of Thomas C. Gregory.
A complete encyclopedia of chemical knowledge, unparalleled in its usefulness. Contains over 18,000 items giving up-to-date information on all types of chemicals and raw materials, their chemical formulas, colors, properties, specific gravities, melting and boiling points, solubility, grades, uses, and containers in which they are customarily shipped. It also defines fire hazard and the railroad shipping regulations pertaining to each chemical. And finally, it contains an important survey of the effects of wartime on chemical prices.
765 Double Column Pages.....$12.00

INDUSTRIAL CHEMISTRY
By Emil Raymond Riegel, Professor of Industrial Chemistry, University of Buffalo.
Completely revised and enlarged, this FOURTH EDITION (1942) of Industrial Chemistry contains many new additions for those who wish to familiarize themselves with the rapid changes that new products and processes are bringing about in established industry. Includes the latest developments in such strategically important fields as synthetic rubbers, synthetic fibers, explosives, chemical warfare, and petroleum, and other elements of industrial chemistry bearing on the war effort. At the same time, the author describes thoroughly standard practices throughout the entire industrial chemical field and the content of the book has in no sense been diminished. Also gives complete tables, product figures, and prices.
861 Pages, 275 Illustrations, 50 Chapters.....$5.50

Reinhold Publishing Corp., 330 W. 42nd Street New York, N. Y.

Industrial Research. *F. Russell Bichowsky.* 126 pages. Chemical Publishing Co., Inc., 234 King St., Brooklyn, N. Y., 1942. Price, $2.50.

NEAR the end of the book the author says: "It was fun to write this paragraph * * * *".

It is the reviewer's judgment that the entire writing of the book was fun for Dr. Bichowsky, and when a man does a job for which he is well equipped and which is fun for him, that job is likely to be extremely well done, as it certainly has been in this instance. In fact, it has been so well done that it probably will discourage some prospective authors who have been experiencing a yen to publicize their views on this same subject.

Dr. Bichowsky writes in a delightfully informal and informing fashion that makes the reading of his book a very pleasant as well as profitable experience. One may disagree violently with some of the views he expresses, as for example his somewhat Thurman Arnoldish statements early in the book regarding the possible (or even probable) misuse of patents which, incidentally, seem utterly at variance with his highly realistic treatment of patents later on when he finally comes to grips with this important subject.

His use of stories taken from his own experience is especially deft and clarifies otherwise obscure points in an efficient fashion.

The book is a must for researchers, research directors, executives of corporations financing research, in fact for everyone interested in industrial research for any reason whatsoever.

CARL S. MINER

Food for Thought. *Herman F. Willkie and Paul J. Kolachov.* 209 pages. Indiana Farm Bureau, Inc., Indianapolis, Ind., 1942. Price, $2.00.

THIS book is particularly timely and will be welcomed by bacteriologists, chemists, and engineers. "Food for Thought" deals with the production and utilization of power alcohol as a solution for the farm economic problem.

The authors have divided their book into two sections. The first, 49 pages, deals with the production, utilization, and agricultural aspects of the program. An entirely new approach to the problem is made, both from an economic and technological viewpoint. The power alcohol story is presented in a sane and logical manner without fanfare. A chapter is included in this section on the design of a typical community distillery incorporating the latest principles of operation developed in the laboratories of the authors. The design is flexible enough to permit the use of various carbohydrate crops. Cost analysis data of the construction and operation of these distilleries are included.

The second section, 160 pages, contains a wealth of scientific information. Recent improvements in the manufacture of alcohol, namely, the development of a continuous cooking and mashing system for cereal grains, the development of a continuous process for the production of pure culture distillers' yeast and a preliminary report on fast, continuous fermentation are given. Research and pilot plant work done in connection with these developments are described in detail, and all of the pertinent experimental data are included.

The reviewer is pleased to see these recent improvements and advancements in processes involving the enzymatic method of organic synthesis.

The authors have had wide experience in the manufacture of ethyl alcohol and deserve a great deal of credit for their originality and foresight.

V. IPATIEFF

Minerals in Nutrition. *Zoltan T. Wirtschafter.* 175 pages. Reinhold Publishing Corp., 330 West 42nd St., New York, N. Y. Price, $1.75.

THIS book is a brief and interesting account for the layman of what the author in his dedication calls "the efficient handling of mineral commodities and their transportation in the body".

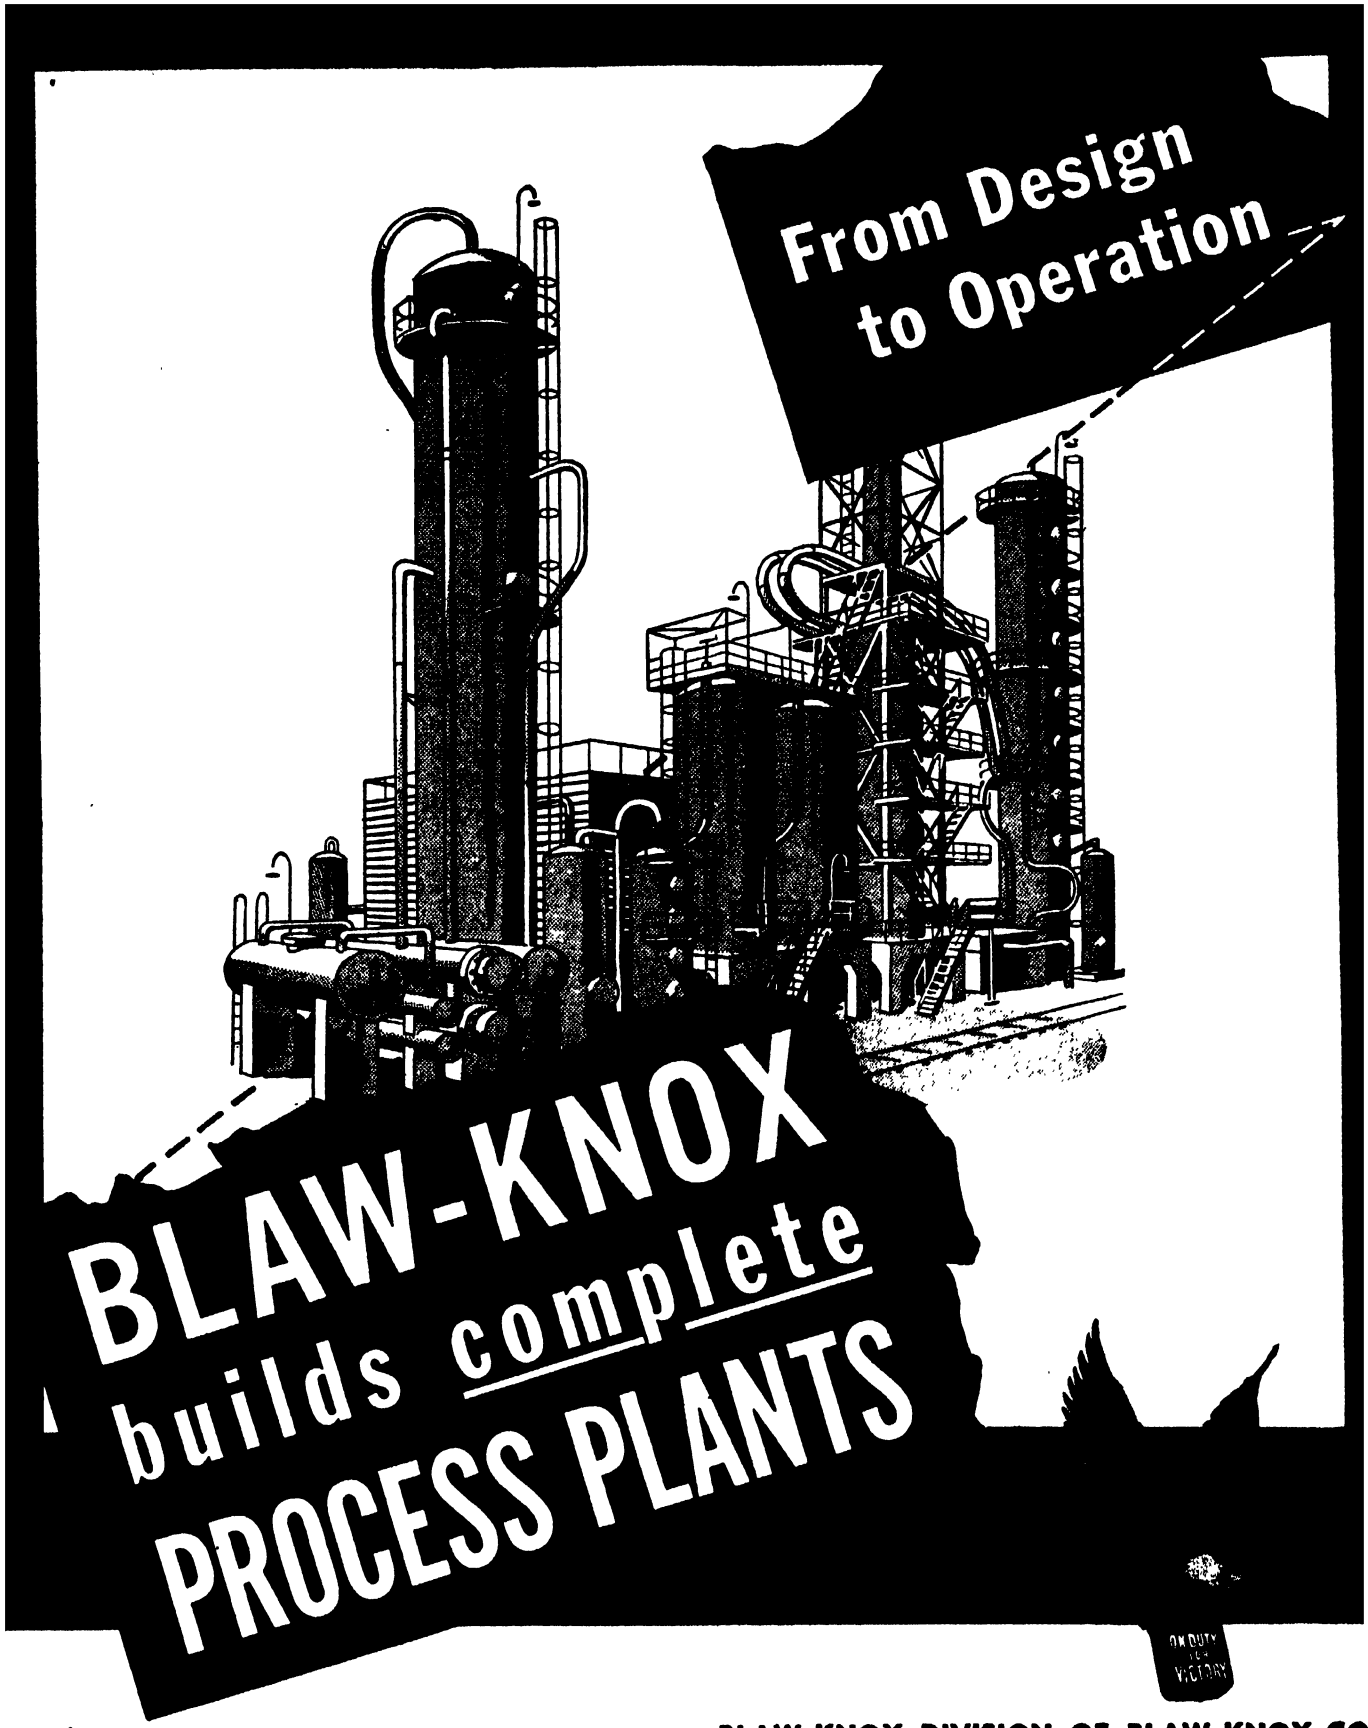
After an introductory chapter explaining what minerals are and making use of classical experiments such as those by Sydney Ringer and Rubner, a chapter each is devoted to common salt, potassium, calcium, magnesium, phosphorus, sulfur, iron, iodine, and "other minerals", comprising what are often called the trace elements.

In general the statements are authoritative, but, as not infrequently happens in books written for the lay reader, the text suffers occasionally in scientific accuracy from the attempt to simplify too much, as when the author (p. 9) speaks of blood cells as "spherical bodies" and (p. 24) when he says that "proteins function as anions in the blood plasma". But these are minor errors and are amply compensated by the general excellence of the presentation as well as scientific accuracy, and they will not detract from the usefulness of the book. Many interesting and effective statements occur throughout the text serving to fix them in the reader's mind. For example, (p. 97) the author states that "wool contains 3.55 per cent and human hair, especially red hair, contains over 5 per cent of sulfur".

The chapters on "What Salt Does in the Body" and on "Calcium" are particularly well written and the latter is illustrated by roentgenograms of the spine in normal and calcium-deficient states.

Each chapter dealing with the principal minerals ends with a useful table of foods in which the particular element treated occurs in greatest proportion and a bibliography which serves as a good introduction to the literature.

This book should prove useful not only for the lay reader for whom it was primarily intended, but for students of the science of nutrition and others who desire a short statement of the functions of minerals in the body.



JOHN R. MUELIN

Strategic Materials in Hemisphere Defense. *M. S. Hessel, W. J. Murphy, and F. A. Hessel.* xv + 235 pages. Hastings House, 67 West 44th St., New York, N. Y., 1942. Price, $2.50.

A RESEARCH executive, his journalist wife, and the editor of *Chemical Industries* have dug up an extensive array of significant statistics, which they have proceeded to build into an excellent presentation of the problem of wartime supplies for America. The volume is much more than a dry Commerce report. Just enough good journalism, with attractive humanized graphic representations of production and import quantities, has been introduced to hold the attention of the casual reader with technical interests. Scientific information has been accurately checked.

The first 153 pages are devoted to a straightforward presentation of facts, figures, and advice classified by materials. Rubber and tin, of course, lead off, followed by 24 other strategic materials, in-

Beyond the Flyleaf

CONTINUED FROM PAGE 1678

cluding such items as quartz crystal and opium, down to jute and hemp.

Part II, 27 pages, deals with Latin America, the several republics and dependencies being taken up successively all with an eye to emergency supplies for the United States. Part III, 47 pages, is devoted to Additional Materials, meaning principally those which have presumably been in abundance and thus were not supposed to be strategic, such as copper and petroleum. An 11-page bibliography, largely classified by material, concludes the work.

The reviewer suspects that the men folk of this group of authors have initiated this work in self-defense, after being overwhelmed with technical inquiries from bewildered clients. Certainly the volume will be of great service to a prospective producer or consumer of basic raw material. It should be a valuable addition to high-school and college libraries, not only for general timely interest, but as a source book for lyceum speeches, term reports, debates, etc.

G. Ross Robertson

Chemistry of Insecticides and Fungicides. *Donald E. H. Frear.* 300 pages. D. Van Nostrand Co., Inc., 250 Fourth Ave., New York, N. Y., 1942. Price, $4.00.

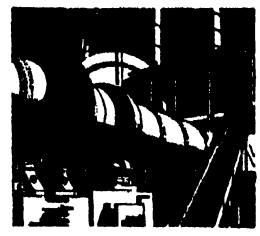
This textbook is designed for chemists, biochemists, economic entomologists, and plant pathologists to facilitate a better understanding of the chemistry of those products used as insecticides and fungicides. It is divided into five parts. Part I deals with "Stomach Poisons or Protective Insecticides"; Part II, "Contact Poisons or Eradicant Insecticides"; Part III, "Fungicides"; Part IV, "Spray Supplements and Residue Removal"; and Part V, "Analytical Methods". Appended to each chapter are numerous references to the more important recent literature as source material for those who wish to pursue any particular subject further. The classification of insecticides into contact and stomach poisons, which is the division generally used by the economic entomologist, brings together in the same chapter a discussion of inorganic fluorine compounds and miscellaneous organic compounds. From the chemical viewpoint a classification of insecticides into organic and inorganic products would seem preferable.

The value of the book is marred somewhat by numerous errors. For example, the use of calcium arsenate in this country is not declining (p. 12), but the consumption may vary widely from year to year, depending upon the degree of infestation of the boll weevil, against which it finds its principal use; the formation of phenothiasone from phenothiasine precedes that of thionol (p. 43); the dinitrocresol used as an insecticide for more than 50 years does not have the structural formula shown (p. 43); there are six position isomers of nicotine, not two (p. 54); the statement that quassin, neoquassin, and picrasmin are possibly related to rotenone is incorrect (p. 88); and the statement, "Both compounds (quassin and neoquassin) have the same empirical formula $C_{28}H_{30}O_6$, contain two methoxyl groups, and are apparently isomeric", is apt to be confusing, especially to the reader for whom this book is intended. Nevertheless, in spite of these defects, the book is one that should be useful both as a text and reference book to anyone seeking a better chemical knowledge in this field.

H. L. Haller

Chemical Engineering Catalog, 27th ed. 1336 pages. Reinhold Publishing Corp., 330 West 42nd St., New York, N. Y., 1942.

The chemical process industries will welcome the new edition of the Chemical Engineering Catalog with its up-to-the-minute information about available equipment. Seldom, if ever, have demands for new manufacturing units topped today's levels and the engineers will find a helpful guide in the 27th edition of C. E. C. for their choice.



The new volume follows closely its familiar predecessors as to scope and order.

Hydrogenation of Coal

Continuing a long-range study of the hydrogenation of coal to produce gasoline, lubricating oil, and other related products, Bureau of Mines chemists are engaged in analyzing the crude oils made from coal to determine their possible uses in various fields of American industry.

Technical Paper 646, "Hydrogenation and Liquefaction of Coal, Part 3, Characterization of Assay Oils", may be obtained for 20 cents from the Superintendent of Documents, Washington, D. C.

Origin of "Bakelite" Plastics

THERE is much need for a better understanding of our patent system. Even intelligent and otherwise well-informed people believe that patents are granted in perpetuity. They have no idea that the great majority of our patents have expired and are expiring daily.

An inventor buys his patent from the Government by disclosing his invention. The disclosure is the consideration for which the patent is granted so that the advance he has contributed in the art is dedicated to public use upon the expiration of the patent. Every patent is a contribution to the sum of human knowledge.

Among many examples that could be cited is L. H. Baekeland's now famous research which resulted in the first successful process for the commercial production of phenol-formaldehyde resin. Baekeland's research permitted control of the properties of the product—the original Bakelite resin—at all stages of reaction and condensation.

Few will deny that the influence of this research and its outcome in the world of materials and product design have been far-reaching. It greatly stimulated scientific interest and activity in the general subject and possibilities of synthetics, thus giving rise to further discoveries in this little-explored domain.

Thirty-five years before Doctor Baekeland began his research in 1906, Adolph Baeyer had observed and written about the behavior of phenols and aldehydes when heated together. Twenty years after Baeyer, another scientist, Kleeburg, experimented with the same materials. Both Baeyer and Kleeburg devoted much effort to the attempted production of an artificial shellac base, but they failed. The substance they made was a shapeless, inert, hard, insoluble, seemingly useless mass, incapable of being formed, and so porous as to be worthless even if it could be worked.

Baekeland, too, sought a shellac base, and found a sirupy resin which heat-hardened into a permanent solid. Unlike the products of Baeyer and Kleeburg, Baekeland's resin was dense and strong, porosity having been prevented by the simple device of maintaining air pressure in the autoclave, which suppressed foaming during the critical thermosetting stage of the final reaction. By studying the failures that had gone before, and supplying the necessary controlling factors, Doctor Baekeland turned to advantage the same characteristics that had defeated his German predecessors, and obtained a product, the properties of which could be assured and stabilized at every stage of both the fluid and solid phase.

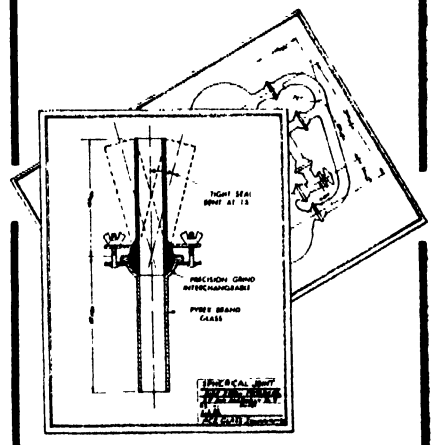
Before Pearl Harbor Bakelite resins in various forms were known the world over for their wide variety of applications—telephone handsets, electrical appliance plugs and outlets, radio cabinets, washing machine agitators, brakelinings, abrasive wheels, steel mill roll neck bearings, automotive ignition parts, and a thousand other diverse uses for peaceful living. Today, they are even more important to the war effort on land, sea, and in the air. Tomorrow, they will again play their important role in peacetime products.

After 36 years, new uses for Bakelite resins are being uncovered and developed at as rapid a pace as ever. To use an old phrase, their field of service is hardly scratched.

Founders' Day of Alpha Chi Sigma

CARL F. PRUTTON, head of the Chemical Engineering Department at the Case School of Applied Science, was the main speaker at the Founders' Day banquet held at the Cleveland Engineering Society on December 4 by the Akron Professional, Case Collegiate, and Cleveland Professional chapters of Alpha Chi Sigma. Speaking on "The Chemical Profession and the War", Professor Prutton pointed out the increasing demands for chemically trained personnel in essential industries and outlined the steps that must be taken to ensure using chemists and chemical engineers where their training is of greatest value.

New Type of Scrap Drive



IN HIS address accepting the Edward Goodrich Acheson Medal of the Electrochemical Society, C. F. Burgess urged a new kind of scrap drive to find, collect, and use the hidden treasure of scientific discoveries laid aside and forgotten in laboratories, libraries, and old reports and records.

Heat Flow through Wet Walls

R. H. DEARBORN, dean of the School of Engineering at Oregon State College, Corvallis, and F. C. McIntosh, Pittsburgh, Penna., chairman of the Committee on Research of the American Society of Heating and Ventilating Engineers, announce the consummation of a cooperative agreement to investigate the heat flow through wet building walls.

The research program will be carried on in the domestic heating laboratory of the College at Corvallis by means of a specially constructed apparatus in a study jointly planned by Earl C. Willey of the college and the research committee of the Oregon Chapter of the Society, of which Edwin W. Neubauer of Portland is chairman.

Unity[1]

The upsurge of labor unionism which has marked the past decade, has not failed to involve the chemical profession in the general controversy of "to be or not to be"—organized. No extensive survey is yet available to indicate the attitude of the chemists themselves on this question. In fact, it is doubtful that many chemists have given the matter serious consideration, unless definitely faced with this issue in connection with their employment. Where this latter condition has arisen, chemists have usually resisted all attempts to include them in the labor unions—e. g., the case of the Shell Development Co.'s Chemist Employees *vs.* the International Federation of Architects, Engineers, Chemists, and Technicians [Chem. Eng. News, 20, 165 (Feb. 10, 1942)]. Whether or not their decision was in their own best interests and those of the chemical profession is not a question to be lightly or quickly decided. Future events may give a definite answer, but we can make an intelligent approach to this question only by carefully considering the data available, both pro and con.

Undoubtedly, the industrial laborer in some respects has benefited from unionization. It has provided him with a more or less equal basis for bargaining with the employer. It has in many cases secured for him higher wages, better working conditions, protection from arbitrary decisions of management and high-handed action of supervisors contrary to his interests—as judged by the union. While some may, with justice, point out the injuries accruing to both labor and management through the strife and strikes which have attended unionization of most major American industries, industrial history leaves no doubt as to the fact that unbridled control of industry by management several decades ago wrought much worse injustices to labor and society in general, for such words as "tenement slums" and "sweat shops" first appeared to disgrace our society with the advent of the Industrial Revolution when the industrialists were in complete control. In brief, while we may consider some labor leaders to be radical crackpots and some actions of unions, irrational enigmas, we cannot doubt that the labor union offers the mass of industrial workers the most effective means of obtaining industrial justice. Such are the benefits which the labor union offers to any who join it. What then does a scrutiny of the reverse surface of the two-dimensional representation show?

It is to be noted that labor unions, in general, have given precious little evidence of balancing the protection of workers' rights with an awareness of duty—namely, that a fair wage calls for an honest effort to meet fair quality and quantity standards of production. In fact, there can be but little argument that this overemphasis on rights has not been offset by any notable emphasis on duty. The backing of all-out war production, outlawing of strikes, etc., by the unions does not invalidate these observations for they are sacrifices qualified by "for the duration only" tags.

As scientists and members of a profession, chemists must be (and are) more interested in doing the job well than in seeing that all their rights are immediately accorded exact and proper respect. Of course this does not mean that the chemist does not desire and strive for financial advancement, proper working conditions, reasonable supervision, etc. But it does mean he recognizes the important relation between rights and duties, and that adhering to a high personal standard of workmanship is at least as important as receiving a high salary. Consequently, union membership can, at best, exert no influence for the professional advancement of the chemist; and may, at worst, cause him to lose sight of the hard and careful labor required to attain the better rewards available to the chemist, by focusing his attention all too fully on his right to such remuneration. But we need not labor this point, for most chemists realize that failure to keep the eyes on the ball has turned many an opportunity for a double play into a costly error. More briefly, membership in the current labor unions offers the chemist, at best, some economic protection in his job but no prospects of professional advancement.

As to the matter of a separate union for chemists, which would recognize professional aspirations—first, current labor laws as enforced by the NLRB allow only one union to be the collective bargaining representative for the workers in any one plant; second, it is doubtful that membership in such a union could offer any really concrete advantages over membership in the A. C. S. While the Society has not been primarily concerned with the economic status of chemists in the past, it has recently shown increasing awareness of the possibilities for real service to the chemical profession, which lie in that direction. Witness, the current report on the "Economic Status of the Chemist"; the employment services; and the statement on "Employer-Employee Relationships" by the A. C. S. While an even more definite stand on the general and economic rights of the chemist is probably desirable, there can be no doubt that it will be forthcoming if the A. C. S. membership actually and actively desires it.

There are also more concrete and obvious reasons against union membership

THE EKERT CONDENSER

A new condenser, compact and extremely efficient which will out-perform any condenser four times its length in condensing power. Originally designed as a reflux condenser, it has also shown its adaptability as a superior vertical distillation condenser.

Especially recommended in the refluxing or distillation of volatile liquids to eliminate the use of extra long condenser of the usual type.

Experiments carried out with ether, alcohol and steam under intensified conditions not normally encountered, showed exceedingly fine results.

To test its performance as a distillation condenser, live steam was entered directly into the tubulation at the top of the 800 mm size, with the result that the condensate ran cold.

Both the reflux and distillation condenser are identically constructed, in the lengths listed below. Vapors to be condensed travel along a system of water cooled coils which are wound about a water cooled internal cylinder, all of which are finally encased in another large surfaced water cooled external cylindrical jacket. The construction permits cooling of the entire unit with one single continuous circuit of water.

Invented by Mr. W. Ekert of Fritzsche Bros., who has had long experience in reflux condensing, this condenser has already found immediate acceptance by chemists in the essential oil and soap laboratories, both for its compactness and its efficiency.

Obtainable in the following sizes:

P2681	Condenser, Ekert Reflux, Made of Pyrex glass, Pat. Pending, 200 mm Jacket	$15.00
P2682	Condenser, Ekert Distillation, Pat. Pending, 400 mm Jacket	30.00

These condensers can be supplied in larger or intermediate sizes; also with standard taper or spherical connections as ordered at additional cost of the joints only.

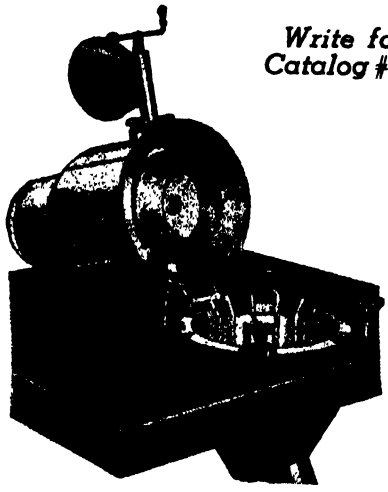
Unity

CONTINUED FROM PAGE 1682

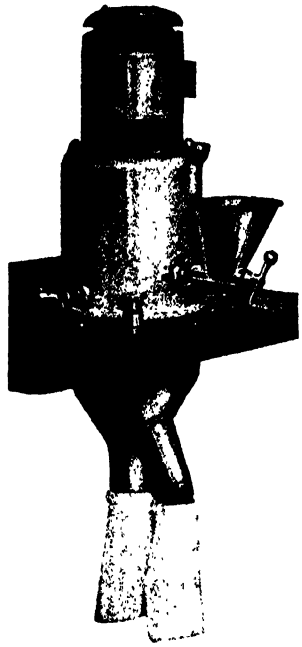
for chemists. In general, the chemist is often engaged in doing confidential work for his employer; even more often in doing work which involves the direction of other workers. In either capacity, it would scarcely behoove him to hold active membership in an organization whose attitude often is essentially "antimanagement". Because his work usually is of a nature requiring cooperation with management, the chemist might well find it impossible properly to discharge his duties and remain loyal to a union. In addition, advancement usually comes to the chemist through recognition by the *management* of work well done; hence, union membership could scarcely further such advancement.

While the foregoing does not constitute any exhaustive consideration of the subject, it should indicate why chemists have, to date, been unresponsive to the "call of the union". Before closing, it should be pointed out that the above remarks apply only to those who possess or seek to acquire those attributes of mind and knowledge which are the stamp of the professional chemist. No doubt, if there are workers in routine chemical jobs who neither "possess nor strive thus", they would probably benefit from union membership even as other industrial workers have. —G. A. BURKART



Detroit Chemist. EDITOR'S NOTE. *Two other objections often raised to unions as now run are the difficulty in firing a worthless man and the penalty inflicted by "seniority" on the young, ambitious man.*

Test Separations of FINE PARTICLE SIZE PRODUCTS



You can produce extremely fine and uniform finished materials with the Raymond Laboratory Air Separator. Specially designed for experimental work in classifying chemicals, pigments, insecticides, clays, talc, cement, powdered foods and other dry materials.

The fineness is regulated by means of a set of interchangeable whizzers and fans, which are furnished with the machine. The complete unit comes mounted on a metal base with sockets for pipe legs.

Write for Catalog #48

Separator tilts back for easy cleaning or for changing whizzers and fans.

Toast to the Flag[1]

John D. Barry

HERE'S to the Red of it;
There's not a thread of it
In all the spread of it
From foot to head
But heroes bled for it,
Faced steel and lead for it,
Slept with the dead for it,
Bathing it Red.

Here's to the White of it;
Who knows the might of it
But thrills at the sight of it
Through day and night.
Womanhood's care for it
Made manhood dare for it;
Purity's prayer for it
Kept it so White.

Here's to the Blue of it;
Heavenly hue of it,
Star-spangled view of it,
Constant and true;
And here's to the whole of it,
Stars, stripes, and pole of it,
Here's to the Soul of it—
Red, White, and Blue.

Soap as a Road Builder

Editor:

The November 10 edition of CHEMICAL AND ENGINEERING NEWS, page 1462, contains an article on the use of "Soap as a Road Builder". The intimation, presumably, is that this is an innovation.

There is available a series of articles on this subject, showing that the engineers who care for the New York State highways have employed stearates and related soaps for mixture with cement to resist scaling and other corrosive effects of calcium chloride, sodium chloride, and the other commonly used ice melters.

An interesting review of Herbert F. Kriege's talk on this subject before the Toledo Section of the AMERICAN CHEMICAL SOCIETY appears in the January issue of *Isotopics*. The talk was given in December, 1941.

The L. S. O. G. Exchange

Edited by A. A. Ashdown, Ed. F. Degering, J. E. Hawkins, and S. L. Redman

Send items to Ed. F. Degering, Department of Chemistry, Purdue University, Lafayette, Ind.

IN ADDITION to the problems of other sections, the New York Section has responsibilities that come with its location and a large membership, now more than 2,800.

There are the problems of planning meetings that will appeal to a membership of widely diverse interests, bringing some members many miles from the outside research centers and institutions into the city, and keeping others downtown at night in spite of other numerous and seemingly compelling demands on their time.

To meet these requirements, programs are based in part on the proved common desire to see and hear famous men. Single programs often present three or four distinguished chemists, any one of whom alone would honor any platform. Such programs fill the meeting hall at the Pennsylvania Hotel. The programs are planned also on the belief that the meetings should provide not only information but also inspiration and renewed encouragement to each one who attends.

The *Indicator*, published in collaboration with the New Jersey and Western Connecticut Sections and edited by F. W. Zons, is a several thousand dollars a year business and returns a profit that, though small in percentage of the gross, is very helpful.

The Membership Committee is active and has obtained 280 members in the past two years under the chairmanship of William F. O'Connor. Secretarial work of the section is necessarily heavy but is handled ably by Cornelia T. Snell with the help of a part-time stenographer.

Another feature that has been found successful is the annual students' program which precedes a regular section meeting. A well-planned session with students presenting, listening to, and discussing papers achieves several objectives. The speakers gain the valuable experience of presenting technical papers to an eager, receptive audience. In addition to the information and inspiration it provides, the meeting marks for many the beginning of that professional contact and association which form the basis of the SOCIETY. It also affords the New York Section the opportunity of acquainting a large number of student affiliates, junior, and prospective members with the sort of symposia that they soon will endeavor to attend not only locally but, we hope, at the national meetings. The interest of chemistry teachers in the project is apparent.

Although the speakers present the results of experimental research, the content and presentation must not ignore the limited specialization of the audience. Senior research, a bachelor's, master's, and occasionally a Ph.D. thesis supply most of the material. An attempt is made to have all schools in the area represented on the program as well as in the audience. The meeting is held at 5:00 P. M. Three divisions, physical-inorganic, organic, and chemical engineering, simultaneously offer three papers each. The papers are scheduled for 15-minute presentation. Presiding at each section is a member of the faculty of a school not presenting a student speaker. Questions and discussion are encouraged. The proximity of the three meeting halls facilitates attendance at papers in different divisions. Following the divisional programs, a general paper is presented to the combined groups. The Chairman of the section then invites all to the regular evening meeting at which distinguished speakers provide the proper inspiration in addition to being helpfully informative.

THE WALL STREET OF CHEMISTRY

Securities and Exchange Commission has made public the second of a new series of advance releases of the Survey of American Listed Corporations. The four corporations comprising this group are manufacturers of fertilizers and include the American Agricultural Chemical Co., (of Del.), Davison Chemical Corp., International Minerals & Chemical Corp., and Virginia-Carolina Chemical Corp.

These reports give data for net sales, net profits, net profit as a per cent of sales, total dividends, and total assets for 1941 and 1942 for individual companies and for the group as a whole. Remuneration data for 1942 are shown for the recipient of the highest, second highest, and third highest individual amounts paid by these corporations and the total which each company paid to all its officers and directors. These data are presented in advance of the complete industry reports released by the Survey of American Listed Corporations and are compiled from annual reports for companies with fiscal years ending in the same calendar year.

For the four corporations, the combined sales amounted to $82,000,000 in 1942 against $67,000,000 in 1941. Net profit after all charges totaled $5,600,000 in 1942 compared with $2,500,000 in 1941, equivalent to 6.8 and 3.8 per cent of sales, respectively. Total dividends paid amounted to $1,500,000 in 1942 against $1,100,000 in 1941. The combined assets of these corporations totaled $100,000,000 at the end of 1942 compared with $88,000,000 at the end of 1941.

For 1942 the highest remuneration reported was $100,476, second highest $60,000, and third highest $50,500. The total remuneration reported paid by these companies to all officers and directors amounted to $766,480 during this year.

For the year ended September 30, 1942, the **Illinois Zinc Co.** and subsidiaries report net income of $464,763 after depreciation, interest, federal income taxes, and reserve of $60,000 for contingencies. This is equal to $4.88 a share on common and compares with $396,310 of $4.16 a share in the preceding year. Federal income taxes for the year amounted to $160,000, compared with $76,000 in the preceding year. During the year the company reduced its bank loans $100,000, reducing the total outstanding to $300,000, and as of November 30, 1942, paid $132,000, while current bank borrowings of subsidiaries aggregated $50,000. Three additional smelter blocks being erected at the Dumas smelter, leased to the American Zinc Co., are expected to be in operation shortly.

The **Canadian Industrial Alcohol Co.** for the fiscal year ended August 31, 1942, shows net profit of $554,860 after depreciation, income, and excess profits taxes of $556,879 and contingent reserve of $100,000. This is equal to 50 cents a share on combined voting and nonvoting capital stock, and compares with $383,658 or 35 cents a share in the preceding year.

Commercial Solvents Corp. has declared a 30 cent year-end dividend, bringing the total for 1942 to 60 cents, compared with 55 cents for 1941. This is one of the few companies to declare larger dividends in 1942 than in 1941.

Consolidated net income of the **Dow Chemical Co.** and subsidiaries for the three months ended August 31, 1942, was $2,147,705, equivalent to $1.66 per share on common. This compares with $2,104,282 or $1.79 per share in the third quarter of 1941.

The **A. O. Smith Corp.** and subsidiaries for the fiscal year ended July 31, 1942, show net income of $3,703,114 after depreciation and amortization of properties, reserve for taxes, etc. This is equal to $7.42 a share, and compares with $2,734,657 or $5.49 in the preceding year.

E. R. Squibb & Sons and subsidiaries report for the quarter ended September 30, 1942, net profit of $455,279 after charges and provision of $509,059 for federal and Canadian income and excess profits taxes. This is equal to 90 cents a share on common and compares with $520,236 or 95 cents per share in the September quarter of 1941.

Hiram Walker-Gooderham Worts, Ltd., has discontinued distilling for beverage purposes in its United States and Canadian plants and manufacturing facilities are now utilized 100 per cent in the production of alcohol. U. S. plants have a distilling capacity of approximately 22,000,000 wine gallons of 190-proof alcohol per year. For the fiscal year ended August 31, 1942, the net profit reported is $7,123,579 or $9.07 per share, compared with $6,921,969 or $8.78 in the preceding fiscal year. Sales set a new high at $150,492,421, compared with $102,156,227 in the previous year.

Another feature of the program which is received with enthusiasm is the group dinner, moderately priced at less than a dollar. This, taking place prior to the evening meeting, contributes to the continuity of the whole program.

Last year's meeting attracted well over 300 students from 12 schools. One meeting of this type is included on the section's yearly agendum.—RALPH H. MÜLLER, *New York Section.*

"ON THE SPOT" But Keeping Step

These are not times for ORDINARY performance by either men or equipment—they are all "on the spot". It's a case of PRODUCE—*or else!*

Thanks to the care in design and construction that has *always* gone into Roots-Connersville Rotary Positive and Centrifugal air and gas handling equipment, their performance and endurance under record-smashing production efforts have proved they can "take it".

Firms which can extend the necessary priorities should consider their future requirements now, since heavy war-time demands have caused delays in shipping which are unavoidable.

Rotary Positive Blower handling CO_2 gas in a mid-western chemical plant. Capacity 225 CFM, 5 lbs. pressure, 690 RPM.

Fiber Conduit Has Wide Field of Potential Use

In view of the metal shortage great interest has been shown in the possibilities of fiber conduit such as Bermico, a product of Brown Company, manufacturers of wood cellulose products.

In the production of Bermico, wood cellulose fibers are scientifically built up and heat-treated to form rugged tubes with a solid homogeneous wall structure. These tubes are then impregnated by a special process to produce a chemically inert, light weight pipe with high mechanical strength and water resistance. Significantly, Bermico is made 100 per cent from noncritical materials.

Millions of feet of Bermico are put under ground each year for the installation of electrical cables. Lately Bermico fiber conduit has been used in place of critical metal conduit. Another new application is for inside drain pipe to carry off rain water. Bermico is also now being used as a protective jacket to prolong the life of metal pipe exposed to corrosive action of liquids or gases.

In addition to the uses already mentioned, certain types of Bermico seem to offer possibilities as a soil pipe, as well as for drainage lines and as casing in shallow oil wells. Other private experiments are being conducted to determine the adaptability of Bermico as a war time alternate for specialized applications. Samples of Bermico and complete information may be obtained from Brown Company's General Sales Office at 500 Fifth Avenue, New York City.

Farm Product Used by du Pont

A CARAVAN of 50,000 five-ton trucks, bumper to bumper, stretching over 236 miles of highway from Washington, D. C., to New York would be needed to haul the farm products purchased by du Pont in one pre-war year.

Today even larger tonnages of crops grown on American farms have been added to the colossal procession needed to meet wartime demands for chemicals. Vegetable oils, turpentine, cotton, cotton linters, and wood pulp, to name but a few, go daily to chemical factories in various sections of the United States, to be converted into products essential for peace—and war.

FERDINAND A. KERTESS, of the Chemical Marketing Co., Inc., New York, N. Y., and three others were accused on November 6 before a Federal Grand Jury of scheming to send to Germany strategic metals of the platinum group—rhodium, iridium, and palladium. During 1940 and 1941 it was said, the group had smuggled to Germany more than $14,000 worth of these metals. Dr. Kertess pleaded not guilty and was freed in $7,500 bail.

Swedish-Finnish Trade Pact

TERMS of the Swedish-Finnish trade agreement for the first six months of 1943, recently concluded, provide that Swedish exports to Finland are to be maintained at the 1942 level. In addition Sweden is to grant credit of 10,000,000 kronor (about $2,500,000 at par) for Finnish purchases from Sweden, as well as credit of 5,500,000 kroner (about $1,375,000) for financing Finnish imports of Danish butter. Under a trade agreement concluded in May and valid to December 31, this year, Sweden was to export goods to Finland in the amount of 35,000,000 kroner, or about $8,750,000 at par. In addition Sweden allowed Finland a credit of 35,000,000 kronor with which to purchase foodstuffs from Denmark. Finland, in return, was to export goods to Sweden to the extent her supplies permitted.

THE French Kali-Chemie A.-G. reports that sales showed a substantial increase in 1941, above the average of the last three years before the war. The company is negotiating for the purchase of an electrolytic plant in Alsace and a salt pit and chemical plant in Lorraine.

d-ribose

.....by a New Process

In response to the considerable demand for an economical source of d-ribose, Schwarz Laboratories, Inc., has developed a new and improved process for the production of this rare pentose.

•

For industrial purposes, Schwarz Laboratories, Inc., is prepared to discuss bulk production of d-ribose, in several grades of purity and physical state to meet specific requirements.

•

d-ribose of exceptional purity is available for research purposes

Inquiries are invited

Advances in Starch Study

ERIC HARDY, 47 Woodsorrel Road, Wavertree, Liverpool 15, England

THE wartime importance of starch makes interesting some of the recent advances made in the study of this carbohydrate in different countries. In India, where the cowpea (*Vigna catjang*) is an important food crop, studies of its properties have been made (*2*). Analysis of seeds from the long-podded variety showed 39.2 per cent starch and 11.12 per cent soluble carbohydrate. Methods similar to those used commercially in producing cereal starches were applied to the cowpea in the laboratory, and the yields were 20 per cent white starch (87.3 per cent starch, 10.02 per cent moisture, and 0.14 per cent ash) and 74.4 per cent pulp (36.22 per cent protein, 23.1 per cent crude fiber, 27.55 per cent starch, 8.17 per cent moisture, and 4.4 per cent ash).

A 3 per cent cowpea starch paste heated to 90° C. had a viscosity somewhat higher than that of wheat starch, but lower than that of Indian corn starch. However, as the cereal starches decreased in viscosity upon continued heating, the cowpea starch had the highest viscosity after 30 minutes. Gelatinization was found to be slower in cowpea starch than in cereal starches. This relatively small viscosity variation over a wide temperature range renders cowpea starch useful in textile sizing and as a thickener in calico printing.

In America the physical nature of starch has been further studied by Schoch who, in a recent paper (*3*), dealt with degradation and other important points of starch behavior. Degradation into a mushy paste when it is peptized by an alkali or other peptizing agent and the agent then removed, is well known. This degradation is faster and more complete at low than at high temperatures. Surface degradation arises in the skinning of boiled starch paste by evaporation. Autoclaved starch solutions degrade on standing, and degradation is faster the higher the starch concentration. Alkali-peptized starch does not degrade on standing, nor by freezing or evaporation.

Degradation arises in the precipitation of starch from pastes or solutions, and this precipitated starch will not dissolve to its former degree of dispersion, even after being autoclaved. High acidity favors degradation, but when acidity is high enough (pH less than 3) hydrolysis of the starch lessens the quantity of precipitate by forming soluble products. Starches which have been solubilized by dextrinization, oxidation, or ethylation do not degrade readily. They do not skin easily, and if a skin does form it can be redissolved.

Such aspects of starch behavior indicate that the affinity of starch for water is opposed by the stronger association forces acting between starch molecules. Hydration, therefore, can be carried past the gel stage to the colloidal solution stage only with extreme difficulty, and such a colloidal solution degrades easily. A dissociating force stronger than that of water is needed to solubilize starch.

Reference should be made here to Radley's new book on "Starch and Its Derivatives" (*1*), especially because of the increased commercial interest in the manufacture of starch and its derivatives and the connection with potato starch, dextrin, and glucose.

More work must be done before the chemical structure of starch is finally and thoroughly understood, since much of the present literature is conflicting, and research and observations have been made under different conditions. The bacterial fermentation of maize made by Weizmann during the last war introduced a new source of acetone, but this process has been little used in Britain, where potatoes and horse chestnuts form the chief source of starch.

Starch now plays so important a part in the paper and textile industries that its importance as a food source may not always receive its share of attention. Doubtless the future will see greater importance attached to starch iodine, the ethers and esters of starch, the manufacture of starch sirup, glucose sirup or corn sirup, glucose, and commercial dextrose.

In America dustless starch grits have been made from raw starch and a small quantity of gelatinized starch, starch has been converted into a sugar mixture containing between 65 per cent and 70 per cent dextrose equivalent by use of molybdenum catalyst, and it has also been converted to paste with a relatively high starch solid content and low consistency through use of a strong solid acid salt of an amino acid. Thin boiling properties have been given by a water-soluble acid salt of an amide, and it has been made soluble by heating in the presence of water and persulfate.

Liquid Carbon Dioxide in Fire Extinguishing

ENGINEERS saw liquid carbon dioxide on public display for the first time in the Cardox Corp. exhibit at the 31st Annual Safety Congress and Exposition in Chicago.

The liquid carbon dioxide was contained in a miniature, mechanically refrigerated storage tank of about 30-pound capacity, specially built for the exposition. For the usual all-steel construction thick trans-

Liquid carbon dioxide displayed by Cardox Corp. at Annual Safety Congress and Exposition

parent plastic ends were substituted on the tank.

A miniature, composite industrial plant was created for the Safety Exposition to show many times daily a small-scale replica of a typical Cardox engineered fire-extinguishing system in operation. A low-heat alcohol fire was used to activate the system, which automatically detected the fire within a matter of seconds and sounded an alarm bell. A short period was allowed for the imaginary workers to leave the plant before the automatic discharge of carbon dioxide began. While the fire was extinguished almost instantly, the discharge continued long enough to eliminate any possibility of reignition.

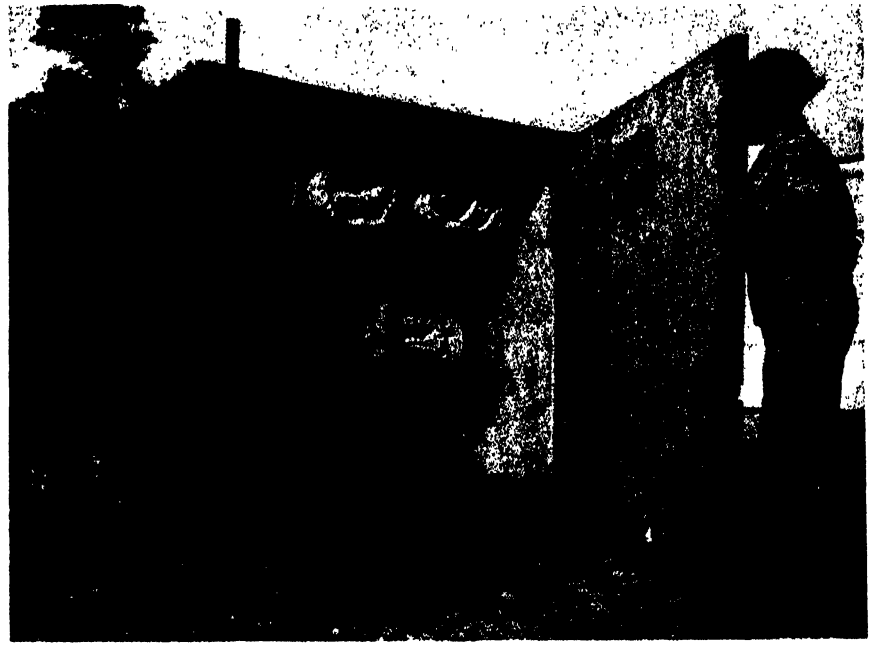
Sterilization with Gas

The Department of Agriculture has long employed methyl bromide and it has been used by private business concerns for disinfecting clothing, buildings, plants, etc.

Not long ago, a model gas sterilizer was set up by the Department of Agriculture and submitted to Camp Lee's Sterilization School for experiments in creating a standard mobile gas sterilization unit.

A complete new gas sterilizer was set up, which is now in the process of manufacture, for use with regular Army units in the field.

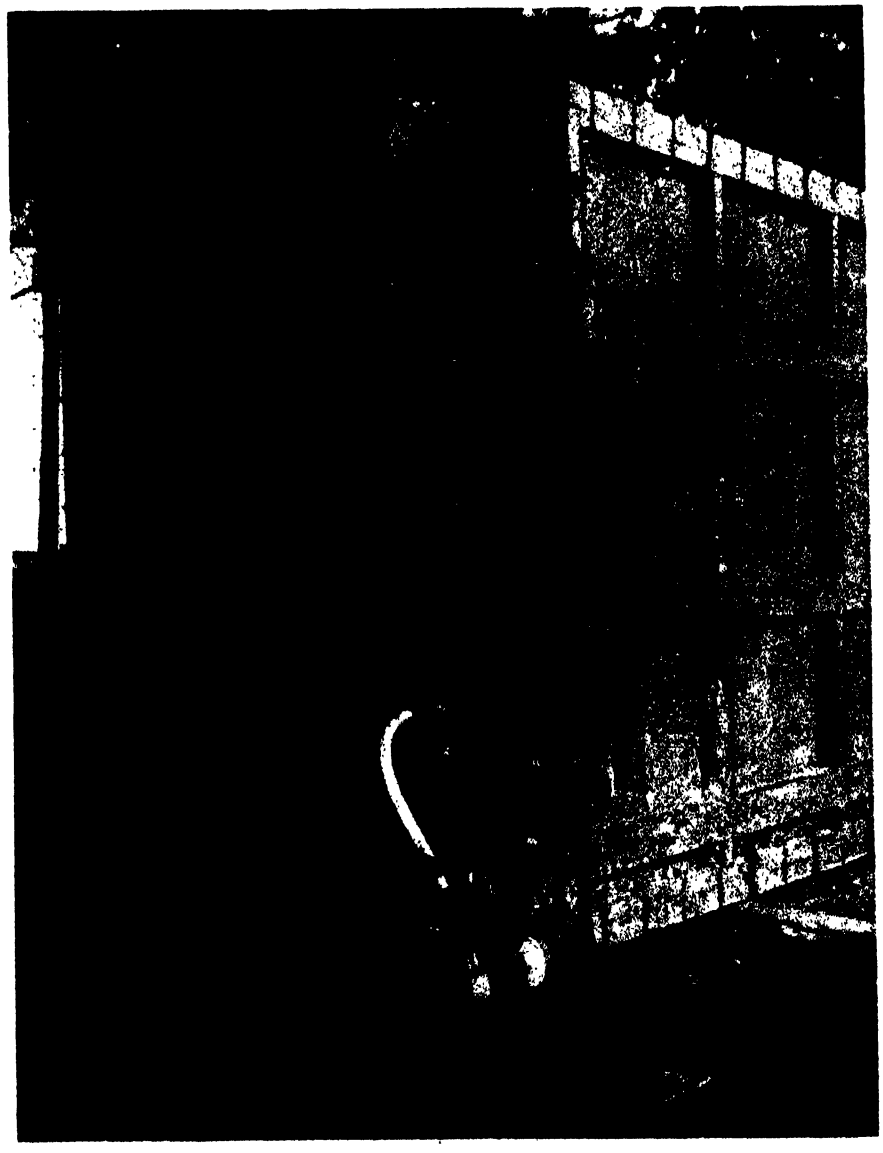
The new portable unit can be set up in 17 minutes, 20 seconds and can take care of from 65 to 75 men's clothes.



The entire unit is collapsible, and two units can be set up in a single large wall tent.

It is planned that a mobile sterilization company will use six units encompassing one run or cycle per hour. On that basis, one company consisting of six units can sterilize clothing for 450 men per hour; and in a 16-hour day the total amount of clothing sterilized will be sufficient for 7,200 men.

Taken apart, the equipment is so compact and light that two entire units can be carried together with motors, tents, and all other essential equipment, in one truck. A trailer carries shower equipment for bathing facilities.



Methyl bromide comes as a liquid, and the equipment is set up so that it will drain through copper tubing, in the form of a coil, immersed in water heated above atmospheric conditions by the exhaust from the portable motor that operates the unit. The liquid turns rapidly to vapor because of the heat in the coils and the low boiling point. The gas is passed into the shaft and blown into the sterilizing chamber by an air circulator run by the air-cooled motor. A complete cycle or run takes 60 minutes.

Lloyd H. Wartman has joined the Research and Development Laboratories of the Bakelite Corp., Bloomfield, N. J.

A general view of the plant layout at the Trenton Valley Distillers Corp., Trenton, Mich.

Ethyl Alcohol Operation by Trenton Valley Distillers Corp.

WAR has brought back into production the model distillation plant of Trenton Valley Distillers Corp., long an inexplicable "orphan" of the industry.

Under the active direction of B. Clark Boeckeler, widely known chemical and distillery engineer, this million-dollar whisky plant has been converted to the production of ethyl alcohol under government allocation for synthetic rubber and smokeless powder. Output was started in September and has now reached the rate of approximately 3,000,000 gallons annually. By early 1943 the rate will have been stepped up to between 5,000,000 and 6,000,000 gallons annually.

The million-dollar plant, located at Trenton, Mich., a down-river suburb of Detroit, was constructed shortly after Repeal. Plagued from the start by lack of working capital, it suspended operations in 1937 after manufacturing and marketing only a few million gallons of whisky. For the past five years the plant, one of the finest and largest in the Middle West, has stood idle.

The trouble was that the company had lavished too much money on fine equipment. After construction costs were paid, the original company, capitalized at $1,250,000, had only $100,000 left as operating funds. Efforts to get additional capital were complicated by the indictment in 1939 of a former president and former vice president of the company on charges of irregularities in the sale of the company's stock.

The company never has gone into receivership. Since 1927 its affairs have been entrusted by the stockholders to Glenn D. Curtis, of the Detroit law firm of Bulkley, Dickinson, Wright & Davis, who has recently been elected president and chairman of the board of directors. Curtis' efforts to effect a reorganization were fruitless, however, until the possibilities of the plant in the war-boomed industrial alcohol field attracted the attention of Boeckeler early this year.

Boeckeler at that time had been for 10 years with the Lummus Co., New York engineering firm which specializes in the erection of chemical plants, oil refineries, and distilleries, and was head of its chemical division. His duties familiarized him with the equipment of most of the country's modern distilleries. Previously he had been a research engineer for Commercial Solvents Co. from 1929 to 1931, working on the distillation of grains in that company's distilleries at Peoria, Ill., and Terre Haute, Ind.

Recognizing a rather peculiar value of the Trenton Valley plant as a possible producer of high-proof industrial alcohol, Boeckeler gathered together some capital in New York and formed the Boeckeler Associates, which now leases the plant from the Trenton Valley Distillers Corp. and is the actual operator. Boeckeler has brought in as his works manager Frank J. Smith, widely known in the distilling industry. Smith formerly was connected with the Seagram Distillers Corp. He was at one time manager of the Calvert distilling plant at Relay, Md., and also was in charge of Seagram's plant at Louisville. Also taking an active part in the new operation is William J. Hale, who has been elected to the board of directors.

The particular feature of the Trenton Valley plant is that it is equipped with rectifying columns with an unusually large number of plates, originally designed for the complete removal of the undesirable constituents of whisky with the idea of producing a whisky which would age quite rapidly and thus could be marketed in a short time. This equipment makes it possible for Boeckeler to produce 190 proof ethyl alcohol on whisky stills, whereas the majority of such alcohol now being turned out by whisky plants is of only 120 to 160 proof.

The normal capacity of the plant is 3,500 distillers' bushels of grain a day. However, some departments are equipped to handle up to 5,500 bushels a day, and Boeckeler hopes eventually to bring the entire plant up to this level, the ultimate capacity being close to 14,000 wine gallons a day.

Since the plant's production of alcohol is earmarked primarily for the synthetic rubber program, and secondarily for smokeless powder manufacture, it gets the highest priorities and Boeckeler has had no trouble getting necessary equipment to convert the plant.

To facilitate handling of the alcohol under government supervision, it was

A view of one of the stills at the Trenton Valley Distillers Corp., from above. These big stills, running up five stories through the plant, were unique in the whisky industry when they were built a few years ago, in that they could produce spirits as high as 192 proof.

necessary to build and equip a bonded warehouse and a denaturing plant. As an economy measure, the new management also constructed a new water-supply system which takes water directly from the Detroit River, about a mile away, eliminating the cost of city water.

Although the denaturing plant was required by the Government, the bulk of the alcohol is shipped undenatured in tank cars to storage depots designated by the Defense Supplies Corporation. Grain, incidentally, is supplied to the distillery by the Commodity Credit Corporation.

Boeckeler considers the distillery among the eight or ten finest in the country. It is amazing, he says, that it should have been allowed to sit idle for so long.

Boeckeler's lease is "for the duration", and he has no plans beyond that time. However, it is not likely that the plant will ever return to the production of whisky. Boeckeler believes synthetic rubber, particularly as it provides a vast market for farmers' grain, is here to stay, and that in peacetime it will require far more than the presently planned wartime facilities for converting grain to alcohol.

Even discounting synthetic rubber entirely, President Curtis points out that there should be a ready market for the company's entire alcohol production in the Detroit area after the war. Industrial users in this area normally consume between two and three times the annual capacity output of alcohol by the Trenton Valley plant, and the freight-rate advantage which the company would enjoy is not to be overlooked.

Bureau of Mines Projects Continued

A MAJORITY of the wartime construction projects of the Bureau of Mines, ordered suspended by the War Production Board, October 20, are to be continued.

Construction work on the bureau's helium plants, explosives research laboratory, synthetic oil project, and pilot plants and laboratories working on aluminum may continue to completion, subject to limitations contained in previously issued Preference Rating Orders. A decision on two additional projects was deferred.

Hormones for Soybeans

THE Glidden Co., Cleveland, Ohio, has developed a method of making sex hormones from soybeans. The company has been in limited production for some time, but demand has increased recently because these hormones are no longer available from Germany and Austria, where they were derived from animal proteins.

Chemical Manufacturers' Indexes

THE September index of the value of chemical manufacturers' inventories, according to the monthly industry survey of the Department of Commerce, was 161.5 compared with 164.4 in August, and 126.0 in September 1941, taking the average month of 1939 at 100.

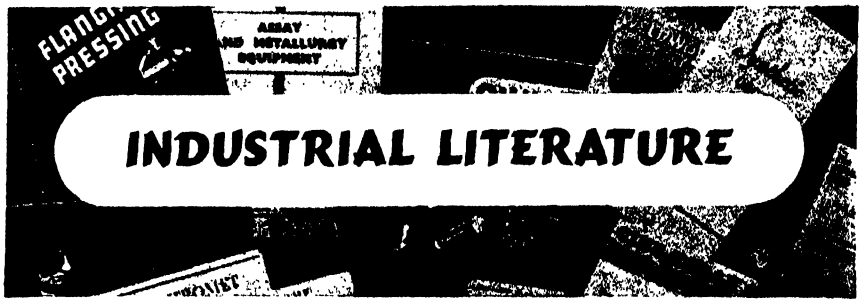
September index of the value of chemical manufacturers' shipments, taking an average month of 1939 at 100, was 185, compared with 171 in August, and 175 in September of the previous year.

New Hemisphere Rubber Source

CRYPTOSTEGIA, a flowering vine in California, Mexico, and Central America may become one of the most important sources of natural rubber for the Americas. It is considered one of the best plant sources of latex.

Most important of the cryptostegia projects, contracted for by the United States Rubber Reserve Co., and the Haitian-American Development Corp., is the planting up to 100,000 acres of the vine in Haiti. In the United States 60 skilled horticulturists are being recruited, and it is estimated that about 100,000 Haitians will find employment when the work is fully organized.

In rainfall, soil and climate, Haiti is believed by agricultural authorities to be one of the more favorable areas for rubber-growing in the Western Hemisphere. Already small amounts of cryptostegia rubber from mature vines have reached the United States for testing. The quality of the rubber is said to be good, comparing favorably with rubber from Hevea and Castilla trees.



Experimental plantings will soon be under way in Cuba, Puerto Rico, Jamaica, Costa Rica, Honduras, and Mexico. These will augment test cultivations now under way in Florida, Texas, Arizona, and California, under the auspices of the Department of Agriculture.

Lacking previous commercial experience, the rubber yield from cryptostegia can only be estimated. Experimenters believe the plant can be safely cropped after the first year and mature plants may yield some 250 pounds of rubber per acre.

Rubber from cryptostegia cures well, the authorities say, has good tensile strength, and is comparable with Hevea rubber. Its resin content is suitable for mixing with synthetic rubber.

The plant also offers some possibilities for by-products—kapok from the floss found in the seed pods; fiber for rope from the stems; and alkaloids as drugs.

Production of cryptostegia requires little steel or other strategic materials and little skilled labor. It is estimated that one man per acre will be sufficient to harvest the leaves.

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

Centrifugal Compressors. This catalog gives a full description of a line of compressors known as Design Nine. Excellent illustrations of the units, as well as of installations accompany the descriptive matter. More than 200 sizes are available. Cross section of the compressor, rating tables, dimensions, line drawings, and performance curves, complete the catalog. *Catalog 386-2 CEN.* B. F. Sturtevant Co., Hyde Park, Boston, Mass.

Chemical Mixing Tanks and Proportioner. A bulletin for industries interested in water softening. The mixing tank is of the vertical, cylindrical type, and embodies numerous improvements which contribute to its efficient and accurate operation. Disk and propeller type proportioners operated by remote control are illustrated and described with line drawings of layouts, specifications, etc. *Bulletin 312 CEN.* Graver Tank & Mfg. Co., Inc., East Chicago, Ind.

Cooling Water Circuits. This booklet, "Microbiological Deposits in Cooling Water Circuits", gives an outline and discussion of the theories offering explanations for some of the types of corrosion in water circuits and the chlorination of condenser waters. Photomicrographs of bacteria and fungi, as well as photographs of pipe sections, water screens, etc., illustrate the text. *Technical Reprint 474 CEN.* Wallace & Tiernan Products Co., Belleville, N. J.

Dehydrant. This bulletin describes Dri-Air chemical powder for the prevention of damage caused by humidity, condensation, rust, mold, mildew, etc., in industrial warehouses, food plants, refineries, confectionaries, etc. This powder will absorb moisture from 1,000 to 1,200 cubic feet of air with 10 pounds of material and is extremely simple to use. *Bulletin CEN.* Tamms Silica Company, 228 North LaSalle St., Chicago, Ill.

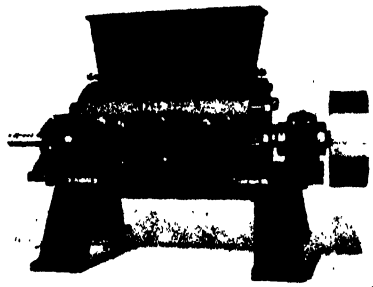
Drills and Reamers. This combination catalog and instruction book entitled "Hardsteel Drills, Reamers, Tool Bits and Special Tools" presents facts about Hardsteel, information on the units manufactured, tables of speeds, use of coolants, sizes of drills, counterboring, grinding, etc. *Catalog CEN.* Black Drill Co., 5005 Euclid Ave., Cleveland, Ohio.

Elevating Equipment. This bulletin describes the art of piling. Photographs and description tell how materials are stacked and moved and how paper rolls, crated goods, cans, barrels, etc., can be handled quickly and efficiently by the Revolvator, an elevating unit that has a revolvable base and telescopic features. *Bulletin 85 G CEN.* Revolvator Co., North Bergen, N. J.

Fire Extinguisher Maintenance. This pamphlet gives directions for inspecting, recharging, and maintaining portable fire extinguishers, and contains information on a number of different types of units. *Pamphlet AD274R CEN.* Pyrene Mfg. Co., 560 Belmont Ave., Newark, N. J.

Floor Patching. A pamphlet on "Instant-Use" resurfacing material, ready-mixed floor patch which allows use of floor immediately following repairs. No skilled labor is required to use this material. *Pamphlet CEN.* Flexrock Co., 23rd & Manning Sts., Philadelphia, Penna.

Graphite Lubricating Handbook. A booklet for all lubricating engineers. Cograph, a natural colloidal graphite, is described. Various formulas are presented. An indexed, alphabetical list of applications is also given. *Handbook, 2nd Edition, CEN.* Nassau Laboratories, Hackensack, N. J.



Instant Steam Generators. This loose-leaf booklet gives a full description of Vapor-Clarkson steam generators, permanent and portable types, hot water generators and spray cleaners, reducing and shut-off valves, safety valves, steam and retarder traps. Illustrations and schematic layouts help to present these units. Flexible metallic joints, heat exchangers, and other accessories are also described. Line drawings, dimension, size, and capacity tables complete the booklet. *Catalog 1010 CEN.* Vapor Car Heating Co., 80 East Jackson Blvd., Chicago, Ill.

Liquid Screens. "Vibrating Screens for Liquids" is the title of an 8-page pamphlet describing operations and applications in the process industries of shaker screens for liquid use. Illustrations of units and of examples of actual installations and performance are given. *Pamphlet CEN.* Robins Conveying Belt Co., 270 Passaic Ave., Passaic, N. J.

Lucite. Methods of fabricating Lucite methyl methacrylate resin into airplane enclosures and other products are described in detail in an illustrated manual on Lucite for Aircraft. Information on the care and handling, sawing, blanking and

IMPROVED ROTARY CUTTER

Designed for granulating dry products with a minimum amount of fines.

Especially desirable in reducing plastics and chemicals of all kinds.

Built in five sizes for both laboratory and plant use.

Send for Catalog Q.

PAUL O. ABBÉ INC

OF LITTLE FALLS, NEW JERSEY

249 Center Street

punching, drilling, threading and tapping, routing and shaping, sanding, scraping, finishing, cleaning, cementing, forming, mounting and installation, and repairing of Lucite is included. *Manual CEN.* PLASTICS DEPARTMENT, E. I. DU PONT DE NEMOURS & Co., INC., Arlington, N. J.

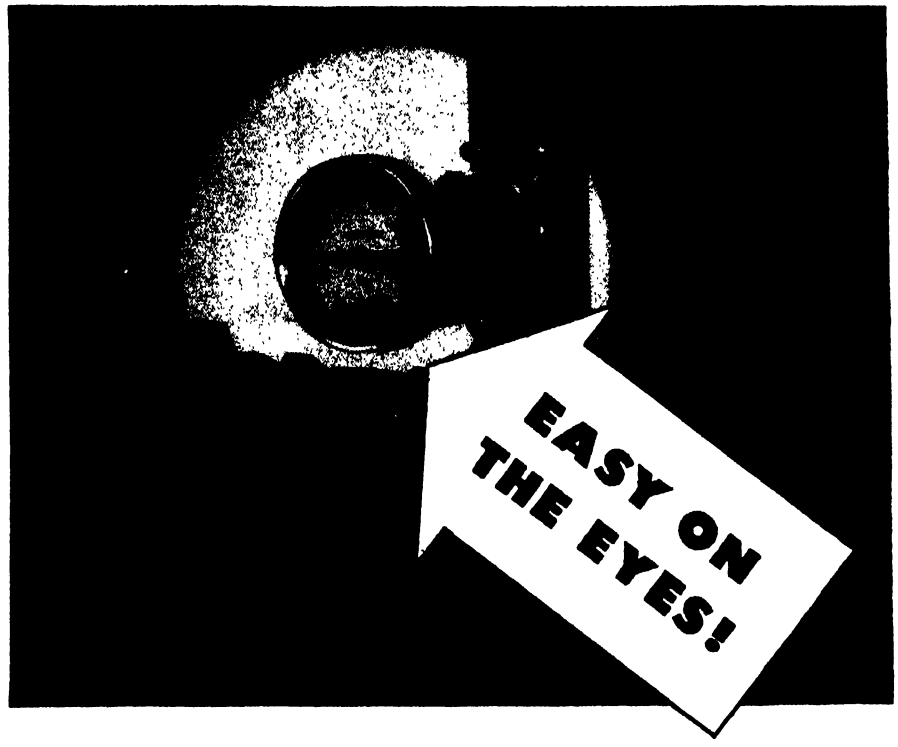
Mixers for Flocculation Tanks. This illustrated folder presents these mixers, in which the shaft is parallel to flow and the paddles rotate across the flow. Pivot paddles are available to increase the degree of agitation without increasing the speed of rotation. *Folder 2042 CEN.* LINK-BELT Co., 307 North Michigan Ave., Chicago, Ill.

Molding and Preforming Presses. This catalog describes and illustrates the semi-automatic toggle-type, compression presses, and single punch and high-speed rotary preforming presses for the plastic industry. It shows the improved Standard line of presses from 20 to 300 tons capacity as well as the Special, automatic equipment for molding closures and threaded parts, presses for buttons, toothbrush handles, and laboratory work. Examples of molded parts and press installations in a number of plants are shown. *Catalog 427 CEN.* F. J. STOKES MACHINE Co., Olney P. O., Philadelphia, Penna.

Paper as a Substitute for Critical Materials. Under the title, "The Development Possibilities of Paper for War Industry" this new 16-page booklet gives information and reference data valuable to those interested in paper as a factor in the solution of today's problems of materials and production. It deals with the various types of paper available and gives an illustrated description of the company's laboratory and production facilities. *Booklet CEN.* BYRON WESTON Co., Dalton, Mass.

Porcelain Products. A 12-page booklet on a wide selection of porcelain products including refractory electrical and dry and wet press electrical porcelains, forms for dipping rubber goods, tubing, and other units for process industries. Photographs accompany the descriptions. Stock items are included with those made to order. *Booklet CEN.* COLONIAL INSULATOR Co., 967 Grant St., Akron, Ohio.

Porcelain Renew. This pamphlet describes a cement, filler, and glaze for repairing industrial porcelain, glassware, enamel, ceramic, or other vitreous ware. This material does not crack, craze, check, or shrink. It is water-, acid-, alkali-, alcohol-, and gasoline-proof and acts as a bond between the broken or chipped surfaces. *Pamphlet CEN.* JOHNSON PRODUCTS Co., 507 Fifth Ave., New York, N. Y.



Presses for Process Industries. This illustrated bulletin gives a good description, with sizes of presses, attachments, etc., of presses for pulp materials, extracting liquids from fruits, laboratory work, compressing dry salts, forming clay products, compressing abrasive materials, molding of thermosetting resins and plastics, hot-plate pressing or curing, etc. The house organ gives a description of presses in war and other work. *Bulletin 4207, House Organ 84 CEN.* THE HYDRAULIC PRESS MFG. Co., Mt. Gilead, Ohio.

Proportioning Burners. This 16-page catalog gives complete information regarding these burners, together with diagrams for automatic hook-ups and illustrations of units with line drawings, charts, capacities, dimensions, etc. A section is devoted to installations in typical plants, and a list of users is appended. *Catalog 407 CEN.* HAUCK MFG. Co., 124-236 10th St., Brooklyn, N. Y.

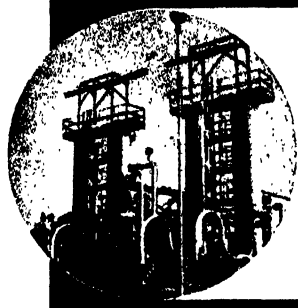
Roller Gravity Conveyors. An illustrated pamphlet, giving specifications and diagrams of these conveyors. This pamphlet tells how the individual parts are designed and made, shows the various accessories, supports, switches, stops, etc., provides a table for selecting conveyors for various package sizes, and shows several actual installations. *Pamphlet Form 642 CEN.* LAMSON CORP., Syracuse, N. Y.

Sound Recorders. This pamphlet on automatic high-speed power level recorders for sound, published in 1940, gives a complete description of the recording units, their uses in testing the sensitivity of photoelectric cells and apparatus operated by them, sound absorption by insulating materials, street and factory noises, vibration of machinery, etc. A fast, continuous, permanent record is provided by these recording units. *Pamphlet CEN.* SOUND APPARATUS Co., 150 West 46th St., New York, N. Y.

Speed Prime Pumps. A folder on a series of pumps designed for the oil indus-

Ruggedness and dependable accuracy, too, distinguish the ALL-METAL THERMOMETER

Readability in an indicating thermometer is an outstanding advantage *if* full dependence can be placed on each reading. Thus the WESTON thermometer has been widely adopted throughout the process industries: because it provides both these essential factors . . . readability and dependability . . . without compromise. It's simple, all-metal temperature principle . . . minus gases, liquids, capillary and involved mechanisms . . . assures "on-the-dot" accuracy over a far longer period of time. In addition, this all-metal construction safeguards against failures due to vibration or over-ranging. *You're more certain of your reading . . . with a* WESTON.



WESTON all-metal thermometers are supplied in types and diameters for most industrial applications and in stem lengths from 2½ to 24". Accuracy, over the entire scale, guaranteed within 1% for the industrial models . . . ½ of 1% for the laboratory model. Literature gladly sent on request, although production facilities are at present devoted solely to the war effort. Weston Electrical Instrument Corporation, 660 Frelinghuysen Avenue, Newark, N. J.

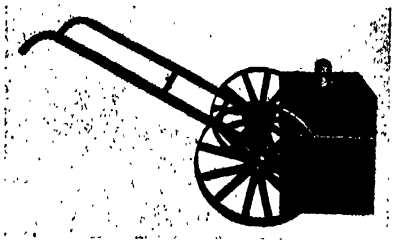
CHARLOTTE NORTH CAROLINA

Specify Florite Desiccant



A NATURAL GAS PLANT is the illustration — might have been a unit for dehydrating propane, butane, gasoline, air, nitrogen, carbon dioxide, refrigeration compounds, or other fluids. All these are treated with superior drying efficiency by use of FLORITE. Hard, granular, stable, non-corrosive, non-poisonous, available in various mesh sizes. Selectively adsorbs 4 to 20% its weight of water — is regenerated by heating to 350°F. Write for literature — names of important users in your own field.

FLORIDIN COMPANY, INC.
ADSORBENTS
159 LIBERTY AVE. WARREN

try but applicable to other fields as well. These units are portable, have capacities from 3,000 to 125,000 gallons per hour. Capacity tables and photographs accompany the description of these pumps. More information is available in catalog form. *Folder 423 or Catalog 400 CEN.* CHAIN BELT Co., Milwaukee, Wis.

Valves. A catalog which contains 176 pages and 250 illustrations, with descriptions of bronze and iron valves and Dart unions. It also shows sectional views of most of the valves, illustrations of various parts of these units, gives the prices, and contains many tables of valuable information. The catalog is divided into six sections, and a general index is included, *Catalog 42 CEN.* THE FAIRBANKS Co., 393 Lafayette St., New York, N. Y.

Carboy Truck

THE Ipco carboy truck, designed to handle carboys with ease and safety, is made by the Industrial Products Co., 2820 North Fourth St., Philadelphia, Penna.

General Electric Clothing for Women Welders

TO MEET the needs of the many women welders now employed and being trained, the General Electric Co., Schenectady, N. Y., has announced a complete line of safety clothing designed especially for women welding operators. Safety, durability, and smart styling are combined in the new line which is based on the results of an extensive industrial survey of safety requirements for women welders.

Featured in the line are leather sleeves, aprons, jackets, leather gloves, and a special women's head and hair covering.

Rubber Covered Liquid Level Controller

A COMPLETELY rubber- or neoprene-covered liquid level controller has been designed by the Moore Products Co., Philadelphia, Penna., for installation in a standard rubber-covered tee fitting, or for direct mounting in a tank containing corrosive fluids. Rubber-covered steel flexible shaft eliminates packing glands and bearings and also provides a simple friction-free method of transmitting the float motion to an air pilot valve or microswitch as required.

Operating on the principle of force change due to buoyancy, rather than a float riding on a moving level, sensitivity is such that a buoyancy change of less than 8 ounces will result in full travel of the diaphragm-operated control valve. This permits the use of a small 4-inch diameter ball float and short float arm approximately 5.5 inches in length.

ACQUISITION of the Harmon Color Works, East Paterson, N. J., as a wholly owned affiliate, will enable American Home Products Corp. to increase materially its capacity to meet war demands for sulfonamides and other pharmaceuticals.

The arrangement calls for the exchange of 18,000 shares of American Home Products stock for 100 per cent of the stock of the Harmon Color Works.

STAMFORD, CONN.

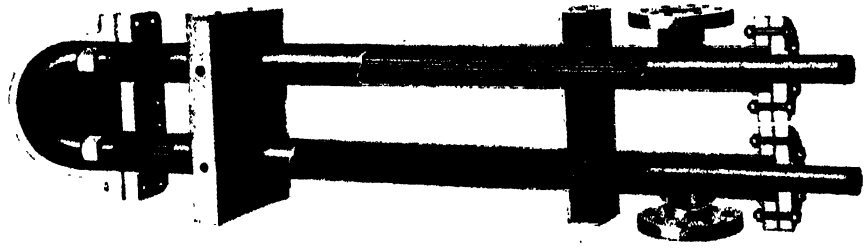
Welded Manifold Valves

Simplification of valve-and-piping hook-ups is made possible through the use of welded manifold valves, manufactured by Zallea Bros. & Johnson, Wilmington, Del. Any number of valves of any type in any size of carbon or stainless steel, chrome iron, nickel, Monel, or other alloys can be combined in an integrated unit. Advantages claimed for welded valves include greater strength with less weight, economy of space, ease of installation, minimum pressure drop, and elimination of bolts, gaskets, and flanged fittings between individual valves.

Brown Fintube to Build Heat Exchangers

The Brown Fintube Co., Elyria, Ohio, is to build and sell complete ready-to-use heat exchangers for the duration.

Exchangers will be built in all standard types, including the twin section unit pictured, and in any capacity desired to meet practically any heating and cooling requirement. Brown Fintubes, with the welded construction that provides an integral bond of metal between the fin and the central member, said to result in high thermal efficiency and trouble-free operation, will be employed as the heat transfer tube in all cases.



Refrigeration

Refrigeration equivalent to the cooling effect produced by the melting of millions of pounds of ice every 24 hours is achieved by a compact unit in a new Du Pont synthetic rubber plant, where temperatures of many degrees below zero are required for the manufacture of an essential ingredient.

A relatively small amount of refrigerant in efficient refrigeration and air-conditioning units not only replaces fantastic quantities of ice but gives the control of heat and humidity without which much vital war production would be slowed or stopped.

Refrigeration is required today in the manufacture of powders and explosives, drugs and pharmaceuticals, chemicals and plastics, communications equipment, military vehicles, wherever atmospheric conditions must be controlled within narrow limits.

Refrigeration and its partner, air conditioning, have assumed new industrial roles in mechanized war which will open untold fields when hostilities cease.

DENSITY CONTROLLER for PULPS

The Masseo-Adams Density Controller, first used in ore classifiers, now has many applications in non-metallic and chemical plants—including potash and phosphate plants, washing coal, etc. Maintains *visual* control of density by motor-operated regulation of dilutant supply valve. Also available with standard chart recorder or with arm and weights for sink and float process. Widely optional location. *In writing, please describe your problem.*

The MINE AND SMELTER SUPPLY CO., Denver, Colo.

Temperature Control for Processing Kettles

AN AUTOMATIC temperature cycle or program control application for a processing kettle, salt bath heat treatment, or a pot-type furnace, incorporating excess temperature shut-off and combustion explosion protection has been developed by the Wheelco Instruments Co., 851 West Harrison St., Chicago, Ill.

The instrument installation is designed to control fuel so as automatically to provide the desired temperature at any period in the process regardless of temperature variations required; to provide a record of temperatures experienced during the cycle; to give excess temperature shut-off protection and protection against burning materials with low flash points, or in the event of fuel valve or instrument failure, and to eliminate combustion hazards. It may be applied to gas- or oil-fired equipment.

Industrial Finishing Progress for 1942

SPEAKING for the Maas & Waldstein Co., Newark, N. J., the more important advances made during 1942 include:

Glossy and matte lacquers, lacquer-enamels and enamels for all purposes formulated from materials that are readily available in the United States and are not likely to be pre-empted by the war industries. A line of wrinkle enamels made from domestic materials.

The metallic-luster lacquers and enamels formerly made with aluminum powders have been replaced with the V-Metalustre line, which contains a nonmetallic lustrous material.

An acceptable substitute for electroplatings was found in a transparent lacquer enamel, known as Platelustre, which simulates brass, copper, bronze, color-treated aluminum and steel, and other metals.

Products developed especially to meet wartime demands include:

Plydur, a clear or pigmented finish for resin-bonded plywood, used in making airplanes and speed boats. Durad luminous paint, used to make objects visible during blackouts. Glasshield, a transparent coating which keeps ordinary glass from shattering when broken by severe vibration.

Solvent Removes Salt and Bunker Fuel Oil

GUNK P-96, concentrated self-emulsifying degreasing solvent made by the Curran Corp., Malden, Mass., is said to be able to dissolve, emulsify, and remove heavy accretions of bunker C fuel oil in the presence of salt water. The degreased surfaces are particularly compatible for the application of red lead undercoat.

Drum Plug Wrench

A DRUM plug wrench designed for removing and tightening plugs or bungs in steel drums has been designed by the Industrial Products Co., 2820 North Fourth St., Philadelphia, Penna.

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see → Display, $10.00 per column inch. 2 inches maximum, larger units at regular display unit rates. No discounts or allowances.
SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 5th and 20th, closing dates for editions of CHEMICAL and ENGINEERING NEWS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete. EMPLOYERS are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers

UNEMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 announcements free (one per issue) set in standard style and limited to 50 words each, including 8-word box address, and 3 additional standard announcements at 50% of regular rate. Further announcements and excess words at full rate.

EMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address

EMPLOYERS seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contracts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemist's Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 505 N. Michigan Avenue, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

WANTED: Instrument Expert by leading aircraft engine manufacturer in East. Engineering training and calibration experience required, not necessarily in aircraft engines. Must be able devise new and note nearly accurate methods of temperature and pressure measurement and improve existing methods. No application sought from persons employed in war production.
Box 11-N-12, Ind. & Eng. Chem., Easton, Pa.

RESEARCH ASSISTANT, preferably college graduate familiar with chemical operations, to assist in physico-chemical investigations in laboratory located in Washington, D. C. Salary and advancement commensurate with ability. Give full particulars; education, experience, race, religion, age and draft status. Enclose recent photograph. An especially good opportunity for a man of some technical ability who is not subject to draft.
Box 21-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, man (with deferment) or woman with basic training in analytical and organic chemistry for laboratory work. Research opportunity probable. War industry, Metropolitan area. Give details of education and experience, salary desired.
Box 27-N-12, Ind. & Eng. Chem., Easton, Pa.

METALLURGIST—acquainted with metallography, industrial radiography, alloy preparation and treatment, and physical testing. Excellent opportunity in light metals field. Give full details in first letter, including minimum salary and photograph. Location Southwest.
Box 31-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER or Chemist. Recent graduate with some experience, as assistant in research and development along chemical engineering and metallurgical lines. Should be capable analyst and handy with tools. Location in East. Give full details, scholastic record, experience, salary desired and recent photograph.
Box 32-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER with experience in chemical plant design, mechanical engineering and product design, to work for plant in East. Must be draft exempt and not employed at your highest skill in any other war plant.
Box 35 N-12, Ind. & Eng. Chem., Easton, Pa.

BACHELOR, recent graduate with good organic training for synthetic work in new organic research laboratory in essential industry. Chicago area (interviews in New York City possible). Submit complete details on education, experience, personal data, salary expected, recent photo.
Box 51-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL ENGINEER—not older than 30 years. Experience in paint formulation advantageous but not essential. Excellent future for qualified man. Submit complete personal, scholastic, and professional data. State draft status and salary expected. All replies confidential. Location Middle West.
Box 55-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST with some petroleum experience. Needed in Chicago area for development of petroleum products and rust preventatives. State age, draft status, degree, and salary desired.
Box 70-NP-12, Ind. & Eng. Chem., Easton, Pa.

ASSISTANT PROFESSOR of Chemical Engineering desired by technical institute in Metropolitan Area. Full-time; teaching Thermodynamics and Chemical Engineering. Applicant should be Protestant and active member of A.I.Ch.E. Send information, together with photograph.
Box 84-N-12, Ind. & Eng. Chem., Easton, Pa.

PLANT DEVELOPMENT: Up to three recent graduates with Ph.D. degree for technical supervision of production departments. Prefer engineering major but physical, inorganic or organic training with practical viewpoint satisfactory. Submit full details of education, references, salary expected and recent photograph.
Box 10-T-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL ENGINEER. Male or Female, with research, testing and development experience in automotive greases and lubricants. Applicant should give age, educational history, experience, and record of previous employment. Location, Metropolitan New York.
Box 11-TP-12, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL ORGANIC Chemists with college degree. Can use both routine analysts trained in organic chemistry and men capable of doing organic research to devise new methods of organic analysis. Metropolitan location in Eastern Pennsylvania. Information regarding draft status required.
Box 13-TP-12, Ind. & Eng. Chem., Easton, Pa.

ORGANIC RESEARCH Chemists with thorough training in organic and physical chemistry. Bachelor's, or higher degrees received within the last few years. Real opportunity for advancement for men of proper qualifications in the research laboratory of a large chemical company located in the East. State draft status.
Box 14-TP-12, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMISTS for analytical laboratory of Research department. Applicants should be graduates in chemistry with their background in organic. Later opportunity for research work for those with good training in organic chemistry. Metropolitan location in East.
Box 15-TP-12, Ind. & Eng. Chem., Easton, Pa.

EXCEPTIONAL OPPORTUNITY for man or woman. Research Chemists and Assistants in progressive organic development laboratory located in New York area. Give training, experience, draft status if male, personal data, salary expected and recent photograph.
Box 17-TP-12, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST: For research work in laboratory in Rhode Island. Apply giving full details.
Box 19-TP-12, Ind. & Eng. Chem., Easton, Pa.

CHEMISTS WANTED, Male or Female, by large company operating in the New York area. Several openings, permanent, available. In some cases, experience or knowledge synthetic resin chemistry and/or paint technology prerequisite. For other openings, basic chemical theory sufficient. Write giving age, draft status, experience, education and salary desired. Your application will be kept confidential.
Box 20-TP-12, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER Wanted, preferably with intermediate and dyestuff experience, is offered permanent position in process development department. Salary based upon qualifications. Please address reply to: General Aniline Works, Process Development Dept., Albany, New York.

WANTED

SUPERINTENDENT of Plant Operations

Chemical Engineer with knowledge of synthetic fibre manufacturing preferred. Specify salary desired.

Box 23-TP-12,
Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC ORGANIC Chemist: Recent graduate, M.S. or Ph.D., wanted by progressive New England firm. Some experience in the synthesis of surface active compounds desirable. In reply, state salary expected, draft status, and experience.
Box 24-TP-12, Ind. & Eng. Chem., Easton, Pa.

CHEMISTS and Chemical Engineers wanted by southern research laboratory. Experience in lignin and cellulose research developments, production and evaluation of paper and chemical pulps, or, production of plastics desirable. Salary commensurate with ability. Write giving full details of experience, draft status and salary desired. Our own staff know of this advertisement. Replies held in strict confidence.
Box 30-TP-12, Ind. & Eng. Chem., Easton, Pa.

RESEARCH FELLOWSHIP available at a large hospital in Brooklyn at $1500 to $1800 per year to develop micro-methods for the estimation of vitamins and hormones. State in detail experience and training.
Box 37-T-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST WANTED for our Newark laboratory, state experience and salary expected. Bensol Products Company, 237 South Street, Newark, New Jersey.

WELL ESTABLISHED and Modern Instrument House wants sales and/or service engineers for middle west and east. Technical education or similar experience important. Should be reasonably draft deferred. Salary and bonus.
Box 39-T-12, Ind. & Eng. Chem., Easton, Pa.

WANTED, CHEMIST for assay control and research work, with some knowledge of ampule manufacture. When answering, state qualifications, education and experience. Concern located in Detroit.
Box 40-TP-12, Ind. & Eng. Chem., Easton, Pa.

EXCEPTIONAL RESEARCH Opportunity for man or woman willing to spend a year in Texas on a new and difficult rubber problem. Should have solid organic background and some knowledge of colloids. Experience less desirable than curiosity and resourcefulness. State draft status, expected salary. Prefer young person now unemployed and available for interview in New York City area. This is field research and applicant should be able to take charge of laboratory, may have assistants.
Box 49-TP-12, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 1698)

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised, or in regard to those seeking employment.

(Situations Open Continued)

MIDWESTERN RESEARCH Institute, active in war work, has openings for two chemical engineers, M.S. or better, and two young women, B.A. or M.A., for analytical work. Reply should include information on education, industrial experience, personal data, salary expected, and photograph.
Box 50-TP-12, Ind. & Eng. Chem., Easton, Pa.

ORGANIC TEXTILE Chemist experienced in research and development of synthetic for textile processing and capable of field application of same. Knowledge of hydrocarbons, fats, resins, surface-active agents, etc. Give full particulars as to age, education, previous employment, etc.
Box 51-TP-12, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER: To take complete charge of small plant manufacturing organic chemicals for war and civilian purposes. Salary, $4,000-$5,000 yearly. Write giving full details, experience, etc.
Box 68-TP-12, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL CHEMISTS wanted for development of drug and cosmetic items for department store sale. Applicants should have sound chemical background and experience in development of formulas and their adaptation to production and packaging. Laboratory and factory in metropolitan New York. Reply by letter stating age, education, experience, marital status, and salary expected.
Box 72-TP-12, Ind. & Eng. Chem., Easton, Pa.

EXPERIENCED CHEMICAL Engineer: Excellent opportunity for man of outstanding qualifications in research laboratories located in the East, occupied with essential activities. Please submit college record, experience, accomplishments and small photo.
Box 73-TP-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, Analyst, woman for analytical testing of inorganic chemicals used in important war industry. New York metropolitan area. Please write details as to education, experience and expected salary. Include small photo.
Box 74-TP-12, Ind. & Eng. Chem., Easton, Pa.

FOOD TECHNOLOGIST

Applications will be welcomed from men with outstanding records to serve as junior chemists in eastern research laboratories, engaged in essential work. Prospects for advancement excellent for men of right qualifications. Please submit record of training and experience, personal history and recent photo.

Box 77-TP-12, Ind. & Eng. Chem., Easton, Pa.

SOUTHWEST LABORATORY requires the services of a thoroughly trained graduate chemist broadly experienced in general analytical work, food analyses and vitamins by chemical, physical, and biological methods. Must be able to meet the public and take complete charge of laboratory if required. Unusual opportunity for rapid advancement. Write complete details, salary required, and include an inexpensive snapshot. Replies kept in strictest confidence.
Box 78-TP-12, Ind. & Eng. Chem., Easton, Pa.

CHEMISTS

With Bachelor or Master degrees for positions in laboratories of Analytical chemistry, Biochemistry, Organic chemistry and Physical chemistry in eastern organization engaged in essential activities. Opportunities for qualified men. Submit details concerning training, experience, personal history, and small photo.

Box 80-TP-12, Ind. & Eng. Chem., Easton, Pa.

OUTSTANDING February or June graduates with a B.S. or M.S. degree are offered graduate assistantships and junior research fellowships at $500 for the college year of ten months with a $180 tuition allowance and exemption from laboratory fees stipend increased annually. The applicant shall have completed at least one year each of inorganic, organic, analytical and physical chemistry, physics and calculus. Send official transcript of college record with photograph and indicate whether available February 1 or June 1. Department of Chemistry, University of Pittsburgh, Pittsburgh, Pennsylvania.

CHEMIST OR CHEMICAL ENGINEER with graduate training in organic and physical or colloid chemistry, for opening with large chemical research laboratory near New York City. Must have ability and initiative for conducting responsible development work. Experience in synthetic resin or paper industries helpful but not required. Give full details, including photograph.
Box 85-TP-12, Ind. & Eng. Chem., Easton, Pa.

ORGANIC RESEARCH Chemist, Ph.D. Excellent opportunity for vigorous and imaginative man with eastern company. Recent graduate preferred. $250 per month. Give full details, including recent snapshot, with letter.
Box 86-TP-12, Ind. & Eng. Chem., Easton, Pa.

WOMEN CHEMISTS: Openings for chemists in defense plant control laboratories for the production of alcohol from grains. Located in Pennsylvania, Ohio, and Kentucky. Give training, personal data, and recent photo in first letter.
Box 87-TP-12, Ind. & Eng. Chem., Easton, Pa.

GOOD OPPORTUNITY for well-trained young chemist, Ph.D., for special analysis and analytical research in drugs and related products. Salary commensurate with qualifications. Give education, experience, references, religious affiliation, etc.
Box 88-TP-12, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER for Research and Market development. Permanent position requiring considerable traveling offered by manufacturer of materials and equipment in the New York-Philadelphia area. Two-four years' experience in sale or operation of process equipment is desirable but not essential. In reply, outline training, experience, draft status, and salary desired. Enclose small photograph.
Box 94-TP-12, Ind. & Eng. Chem., Easton, Pa.

SITUATION OPEN: Laboratory assistant for research and control in large pharmaceutical concern in Connecticut. Must be well equipped in organic chemistry. State academic and draft data and when available.
Box 98-TP-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST with analytical experience to assist in supervising routine chemical testing and develop analytical test methods for a chemical plant located in central New Jersey. Reply by letter stating age, training, experience, dependents, draft status, references, and salary desired.
Box 99-TP-12, Ind. & Eng. Chem., Easton, Pa.

INSTRUCTOR: Man or woman, wanted for semester beginning January; instructorships also available for next fall; general, analytical, organic. Ph.D. preferred, M.A. applicants considered. Apply immediately, giving full details including minimum salary. Chemistry Department, Smith College, Northampton, Mass.

SITUATIONS WANTED
(A.C.S. MEMBERS)

SYNTHETIC ORGANIC chemist. M.S. research and development experience in plastics. Desires organic research position (plastics or other industry) contributing directly to war effort. Young, married, responsible. Presently employed. Metropolitan location preferred.
Box 36-N-10, Ind. & Eng. Chem., Easton, Pa.

VAPOR PHASE catalytic chemist and chemical engineer with ten years' experience, mostly in research and development work with a little plant control. Also some general organic and inorganic experience. Location immaterial. Available immediately.
Box 36-T-11, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D. Eight years' wide research experience with large concern; food products, vitamin synthesis and assays, industrial fermentations. Publications, patents. Now employed, desires position progressive organization undertaking expansion of research or setting up new department. Age 34, married. Available, reasonable notice.
Box 73-T-11, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL, ANALYTICAL Chemist. Ph.D., 1935, large mid-western university. Well trained in inorganic, organic, and physics. Excellent scholastic record; honor societies. Publications. Fifteen years' teaching experience; two and one-half years' experience research chemist with large corporation. Now Associate Professor, teaching physical, thermodynamics, electrochemistry, advanced analytical, in state supported school of technology. Desires responsible position in essential industry. American, age 38, married, one child, 3-A. Available February 1.
Box 25-N-12, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., 26, proven versatility and initiative. Synthesis sulfonamides, vitamin E, arsonic aids, explosives (nitro compounds, nitrates, nitramines). Wide experien... background physical chemistry, research surface chemistry, publications, honor societies. Single, Draft deferred, available immediately.
Box 44-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST: Ph.D., 1936, University of Illinois, Organic and Physiological. Six years' industrial experience including laboratory, field, and pilot-plant work. Especially familiar with soluble polymers, protein insolubilization and leather technology. Age 32, married, two children. Employed in non-war work, draft 3-A. Desires change permitting greater contribution to war effort and requiring less traveling. Location inconsequential; preference, middle west or west.
Box 46-N-12, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, Ph.D., desires position with future. Prefers careful, scientific experimentation and can resolve problems into significant components. Fifteen years' industrial experience studying production of new inorganic compound, solubility diagrams and paper pulp bleaching. Publications and patents. Now employed. Age 43, married, three children, draft 3-A.
Box 48-N-12, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., 1941. One year post-graduate fellowship, desires research and development position in industry. Publications. Age 35, married with dependents, deferred classification in draft. Location immaterial. References.
Box 83-N-12, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, B.S. in Chemistry. Experience in biological chemistry, especially in analytical procedures. Desires something preferably in Rochester, New York, area, contributing to the war effort. Married, available immediately.
Box 12-T-12, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST: Ph.D. in February 1943 from an eastern university, desires research position. Minor in physical chemistry. Also good training in industrial emission spectroscopy. Married, age 25, draft deferred. Member Sigma Xi and Phi Lambda Upsilon. Midwest location preferred.
Box 21-T-12, Ind. & Eng. Chem., Easton, Pa.

RUBBER CHEMIST, B.S. Experienced in analysis, compounding, and physical testing of natural and synthetic rubber. Able to set up laboratory for same. Knowledge and experience in polymerisation techniques. Age 22, draft 2-A.
Box 25-T-12, Ind. & Eng. Chem., Easton, Pa.

PETROLEUM CHEMIST with ten years' experience in special lubricants, lubricant additives, solvents, soluble oils and other specialties desires position with $7500 minimum salary. Research, manufacturing, and technical sales experience.
Box 31-T-12, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. with research experience in diverse fields; now employed, but desires position more closely allied with the war effort; married; location immaterial.
Box 32-T-12, Ind. & Eng. Chem., Easton, Pa.

EXECUTIVE CHEMIST: Over twenty years' experience in manufacture of mechanical rubber goods, rubber covered tools, tanks, latex, synthetic rubber, extenders, etc. Class 3-A. At present head of own company but unable to continue because of priorities and other restrictions. Desires executive or technical position where unusual talents and ability can be used to fullest extent. Able to handle men. Familiar with labor problems.
Box 34-T-12, Ind. & Eng. Chem., Easton, Pa.

SPECIALTIES CHEMIST, Dr., age 48, extensive business, executive and research experience. Seventeen years' owner of large company over there manufacturing waxes, polishes, household specials, sanitary, cosmetics. Four years' practice in U.S.A. References. Desires responsible position with chance. Other fields considered. New York area preferred.
Box 36-T-12, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST desires research position in petroleum field. Experience in gas analysis and fractional distillation methods. Will complete Ph.D. requirements February 1, 1943; available thereafter. Teaching fellow for 2½ years. Sigma Xi, Phi Lambda Upsilon. Publication. Age 24, married, draft status 2-A.
Box 41-T-12, Ind. & Eng. Chem., Easton, Pa.

PATENT ATTORNEY seeks responsible position with chemical corporation. Age 36. Formerly employed in patent department of mid-western organic chemical corporation. Excellent qualifications. Could organize patent department.
Box 42-T-12, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D., 1936, age 34, married, two children, draft status 3-A, now employed. Wide experience with leading companies in research, development and production of pigments, dyestuffs, intermediates, printing inks. Advantageous change desired, preferably research with large progressive company. Excellent references, publications, patents.
Box 43-T-12, Ind. & Eng. Chem., Easton, Pa.

WAR PRODUCTION work wanted by chemist, now employed in research, seeking more responsible position, Ph.D. in physical chemistry, experienced in dyes and pigments and their applications, but willing to start in new field. Citizen, age 26, Eastern location preferred.
Box 45-T-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST: Seven years' experience in toxicology, medico-legal, forensic chemistry. Analytical, interpretive, court testimony. Some research. B.A., with some graduate work. Married, draft 2-A. Prefer Middle West.
Box 47-T-12, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 1699)

(Situations Wanted Continued)

CHEMICAL ENGINEER, Plastics, over sixteen years' experience research and development, plastic molding, cellulosic materials and resin extenders involving cost reduction and development of new molded parts and molding compounds. Married, age 41, draft 3-A. Member American Chemical Society, American Institute of Chemical Engineers, Society of the Plastic Industry. Desire research or development work involving new plastic products.
Box 48-T-12, Ind. & Eng. Chem., Easton, Pa.

ORGANIC RESEARCH Chemist, Ph.D., age 41, with 15 years' experience in laboratory, pilot plant and directing moderate size research groups n process development for manufacture of variety of organic chemicals—solvents, acids, esters, aldehydes, resins and others; process development, properties and use of industrial protein substances; miscellaneous research problems, desires position in research or directing small group. Moderate size organization, midwest location preferred.
Box 53-T-12, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST: B.S., December 1942. Desires position, preferably in research laboratory contributing directly to war effort. Age 22, married, industrious, and responsible. Draft classification, 2-A. Available December 9, 1942. Location unimportant.
Box 55-T-12, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL RESEARCH Chemist desires war research or development work in plastics or colloid chemistry. B.S., Worcester Polytechnic Institute, 1934. Additional academic training in colloid and plastics chemistry. Four years' research experience on high polymers, resins, adhesives, leather processing, and rubber. Capable of operating without supervision and can produce useful ideas. Location desired, eastern seaboard or Pacific coast. Now employed, American, age 30, married, draft 2-B.
Box 58-T-12, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, WOMAN, Ph.D., 1938. Four years' experience in organic, protein and enzyme chemistry in industrial laboratory. Desires research position. Age 28, single.
Box 59-T-12, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. Eight years' post-doctorate academic and industrial research and development; synthetic drugs, pharmaceuticals, bile acids, sex hormones, furans, metallic soaps. Publications, honorary societies. Location desired, metropolitan area. Draft status, 3-A.
Box 60-T-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.A. Broad experience in research and development; specialties, colloidal and surface chemistry. Employed mid-west, desires Eastern location. Age 41, draft 3-A.
Box 63-T-12, Ind. & Eng. Chem., Easton, Pa.

BREWING CHEMIST — BACTERIOLOGIST, organic Ph.D., Europe 1931. Excellent background, 8 years' experience in American brewing industry conducting plant control and as consultant; publications. Married, draft 3-A, seeks suitable position. Versatile linguist. Experienced inorganic analyst. Profound basic training, enabling quick adjustment to related and also other fields.
Box 64-T-12, Ind. & Eng. Chem., Easton, Pa.

DO YOU NEED An Idea Man? Food technologist, Chemical Engineer, M.S. (organic chemistry), desires research or development work in food field. 25 years' practical experience. Has worked on many food processes and products. Eager to tackle your problems.
Box 66-T-12, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST: Analytical, five years' experience in control, development and metallographic work. Now employed, desires to relocate in Newark, New Jersey, area.
Box 67-T-12, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST; A.B. Ohio State. Technical and research director Southern manufacturer of fine chemicals, especially terpenes and pharmaceuticals. Classed 2-B. Desires other "essential" work but with more opportunity to follow-thru on research and development in a permanent and responsible position. Age 32, single.
Box 70-T-12, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST: Ph.D., January 1943 from a large eastern university. Good synthetic background. Experience in heterocyclics, fatty acids. Desires work related to the war effort.
Box 71-T-12, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., 1941. Minor, physical chemistry and physics. Now employed. Desires position in war research. Thesis on hydrocarbons. Single, 26, draft 2-B, Sigma Xi, publications.
Box 75-T-12, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., Columbia University. Years' experience in development work. Desires industrial research or control position preferably in middle west. Draft 3-B, age 32, now employed but available on short notice.
Box 76-T-12, Ind. & Eng. Chem., Easton, Pa.

FOOD CHEMIST, Ph.D. Biochemistry, organic, bacteriology, and food technology minors. Experience in vitamin determinations: animal, chemical, microbiological, and physical. Research on glass-packed foods. Age 26, single, draft 2-B, Protestant. American born, honor societies, scientific societies. Publications. Now employed, desires essential research position with progressive firm in vital war industry. Location unimportant. Available on reasonable notice.
Box 79-T-12, Ind. & Eng. Chem., Easton, Pa.

FERMENTATION OR FOOD INDUSTRY. Ph.D. seeks executive position. Plant and laboratory development or supervision. Alcoholic fermentation: grain, molasses, potatoes, yeast, malt products, enzymology, vitamins, bacteriology.
Box 81-T-12, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D., 1940. 2½ years' experience, largely organic, research department large chemical company. Age 25 years, married, one child, draft 3-A. Prefer eastern location but will consider elsewhere.
Box 90-T-12, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, B.S. in Chemistry 1939, three years' experience as secretary doing literature searching, German translations, patent work, and Photomicrography. Seeks position in New York City.
Box 93-T-12, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, M.S. Seven years' research experience and process development in plant chemistry, bacteriology, mycology and plant pathology. Patents and publications. Age 35, married, class 3-A, deferred. Employed. Prefer position with opportunity for graduate study or research in war industry.
Box 95-T-12, Ind. & Eng. Chem., Easton, Pa.

HORMONE-STEROID ORGANIC Chemist, Ph.D., research or development, desires change to a more progressive firm with opportunity to exploit original novel ideas. Five years' experience in field. Superior scholastic record top midwestern universities. Age 27, American, married, draft deferred.
Box 96-T-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.A. and B.S. from two large state universities. Had graduate assistantship. Research on catalytic and electrolytic reduction. Temporarily employed but available immediately. Age 23, draft status 2-B. Location immaterial.
Box 97-T-12, Ind. & Eng. Chem., Easton, Pa.

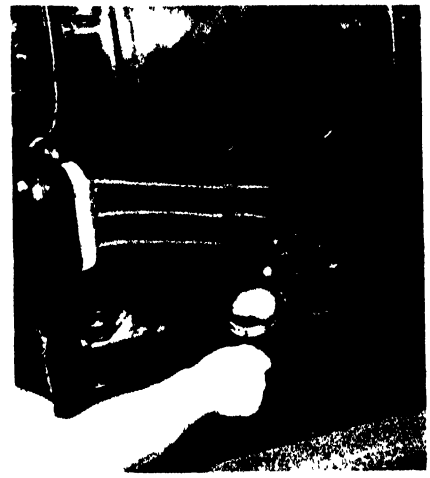
SITUATIONS WANTED
(NONMEMBERS)

GRADUATE CHEMIST, who detests routine laboratory analysis, desires position in development work; not too good for hard work or dirty jobs; six years' varied industrial experience. Chemical background, average. Imagination and ingenuity, above average. Draft, 3-A.
Box 68-N-12, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, B.A. in chemistry, 1942. Biology, four years. Knowledge French, Spanish, typing. Location immaterial. Age 21, Protestant, single, employed but available short notice.
Box 46-T-12, Ind. & Eng. Chem., Easton, Pa.

METALLURGICAL ENGINEER: Mature executive with extensive experience in physical metallurgy, ferrous and non-ferrous including light metals, casting practice, fabrication, plant operation, and metallurgical research seeks permanent position. Industrial, institutional, and educational openings considered. Sc.D., Mass. Inst. of Technology. Now employed.
Box 52-T-12, Ind. & Eng. Chem., Easton, Pa.

BIOLOGIST, M.S., 1937. Five years' practical experience as a mycologist. Limited training in bacteriology. Woman, age 28, single. Nonmetropolitan area preferred.
Box 54-T-12, Ind. & Eng. Chem., Easton, Pa.



CHEMICAL ENGINEER, M.S., in 1940 from prominent mid-west University. Desires position in production or development work. 1½ years' experience, employed now in East but mid-west location preferred. Dependable and hard-working. Age 31, married, one child, draft 3-A.
Box 61-T-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.D. Age 30, 2½ years' metallurgical chemist, approximately two years' supervisor explosives laboratory. Desires either research or supervisory work in essential war industry. Release obtainable immediately. Draft status, 2-B.
Box 65-T-12, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S. One year of graduate organic chemistry. Two years' supervision experience in powder and explosives laboratory. Wants position research or analytical in essential work.
Box 82-T-12, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST, B.A., 1940. Some graduate work. 1½ years' experience in large pharmaceutical house. Desires position in organic synthesis. Eastern location preferred. Age 23, draft deferment assured. Now employed, but available on short notice.
Box 83-T-12, Ind. & Eng. Chem., Easton, Pa.

Determining Induction Motor Horsepower from Ammeter Readings

A SIMPLE method has been developed whereby loading on integral-horsepower induction motors can be determined with practical accuracy by means of a hook-on volt-ammeter. This method has been used with practical results by several plant electricians for a number of years, and has been checked for accuracy with design data of motors. It has been presented by the Industrial Department, General Electric Co., Denver, Colo.

Photoelectric Color Grader

A RAPID means of grading the color of rosin, other naval stores products, and other resins, is a photoelectric photometer developed by Robert H. Osborn, chemist at the Experiment Station research laboratories of Hercules Powder Co., Wilmington, Del. The apparatus consists of a light source, colored glass filters, and a photocell.

The Rubicon Co. of Philadelphia is the manufacturer. Hercules is making the color grader available to other laboratories through a royalty-free license.

New War Products Development Laboratories

THE Curran Corp., Malden, Mass., has opened a new War Products Development Laboratory to be located in the Processing Plant, Prospect Mills, Lawrence, Mass. The purpose of the laboratory is to put its creative chemists on the development of both offensive and defensive war chemicals.

Reclaiming Foundry Core Sand

ANNOUNCEMENT is made by Link-Belt Co., 300 West Pershing Road, Chicago, of the development of a new method of reclaiming foundry core sand.

BUSINESS OPPORTUNITIES • FOR SALE • WANTED • ETC.

MISCELLANEOUS

Five cents a word, minimum charge $2.00; display available at $10.00 per inch to be paid in advance. No discounts or allowances

MICRO-ELEMENTARY ANALYSES: C, H, N, S, P, Halogens, Methoxyl, Mol. wt., etc., U.S.P. and other official tests, Purity tests, Microinorganic assays, Spot tests, Micro-distillations, Toxicological investigations, and typical micro-chemical research work. Dr. Carl Tiedcke, 366 Fifth Avenue, New York, N. Y.

NEED EQUIPMENT? Then contact The Laboratory Exchange at New York. Write, wire or phone whatever your needs are in laboratory equipment. Your inquiry will receive immediate attention. We have served American chemistry for ten years with fine used guaranteed equipment. Reasonably priced. The Laboratory Exchange, 24 E. 21st St., New York City.

HORMONES WANTED: Will buy and contract for long term purchase all crystalline hormones, Folliculine, Gonadotropine, Testosterone esters, also extracts purified and solutions. Give full information, quantity, price, potencies, assays, etc.
Box 30-N-12, Ind. & Eng. Chem., Easton, Pa.

WANTED: One new or used Abbé refractometer. Lady Esther, Ltd., 7171 West 65th Street, Chicago, Ill.

TENSILE TESTING machine wanted immediately for war work. We will buy, or rent for the duration, a machine which will test 8" × ½" × 1/8" plastic strips. Minimum capacity, 2,000 pounds.
Box 29-T-12, Ind. & Eng. Chem., Easton, Pa.

LABORATORY SIZE Vacuum Drum Dryer wanted, new or used. State full particulars, location and price.
Box 56-T-12, Ind. & Eng. Chem., Easton, Pa.

WANTED: Mellor's Comprehensive Treatise Inorganic Theoretical Chemistry, Vols. 8–16 or complete. Journal Chemical Education, Vols. 1 and 2. Journal American Chemical Society, Vols. 1–13 or 1–25.
Box 57-T-12, Ind. & Eng. Chem., Easton, Pa.

WANTED TO BUY. Are you selling your laboratory or individual instruments? Then contact us and receive the very highest possible cash offer. We are urgently in need of all the equipment we can possibly obtain and will pay cash for immediate delivery. Write, wire or phone. The Laboratory Exchange, 24 E. 21st St., New York City, Algonquin 4-3879.

LABORATORY CALENDER Wanted: Urgently needed for use in connection with vital war work.
Box 18-T-12, Ind. & Eng. Chem., Easton, Pa.

AUTOCLAVE FOR SALE: One gallon Pfaudler, 1000 lb. per sq. inch. Direct fired, without burner. Belt driven anchor agitator, no motor. Gauge. Glass Liner, but glaze poor condition. $100.00, F.O.B., Laboratories Dr. George Piness, 672 South Westlake Avenue, Los Angeles, California.

WE OFFER: Amyl, Hexyl, Octyl, Furfuryl Alcohols. Phosphomolybdic, Phosphotungstic, Silicotungstic, Acids. Antimony, Chloride and Trifluoride. Chromium Fluoride. Cobaltous Nitrate. Barium Monoxide. Boron, Columbium, Caesium, Gallium, Germanium, Indium, Molybdenum, Rubidium, Titanium, Vanadium Metals.
Box 27-T-12, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Complete set Industrial & Engineering Chemistry, volumes 1-33; $150. Complete set Analytical Edition, volumes 1-13; $25. Journal American Chemical Society, 1904-1933, volumes 26-55, $150. All in perfect condition; mostly unbound.
Box 28-T-12, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: J. Chem. Education, volumes 1-17 inclusive, unbound, excellent condition. Any reasonable offer. M. W. Graffin, Hercules Powder Company, Wilmington, Delaware.

FOR SALE: Chemical Abstracts, complete, with all decennial indexes. Journal American Chemical Society, complete, 1907 to date. Journal Chemical Education, complete. Industrial Engineering Chemistry, and Chemical & Metallurgical Engineering, nearly complete.
Box 44-T-12, Ind. & Eng. Chem., Easton, Pa.

WE OFFER competent research service in organic chemistry. Organic syntheses. Private research laboratory. Room 206, 1007 McCartney Street, Pittsburgh, Pa.

FOR SALE: Chemical Abstracts, v. 1-32, including 3 decennial indices. Industrial and Engineering Chemistry, v. 1-30. Analytical Edition, v. 1-10. Journal American Chemical Society, v. 25-60. All bound, excellent condition. Will accept any reasonable offer.
Box 69-T-12, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Chemical Abstracts, volumes 14-27 inclusive with second decennial index, complete and in good condition, $60. Sold separately, Chemical Abstracts, $30. Decennial Index (author and subject) $35. Write Benton Owen, North Haven, Connecticut.

FOR SALE: Bound, complete Chemical Abstracts and first Decennial Index. Complete Industrial and Engineering Chemistry unbound except two volumes. Analytical Edition complete, unbound. Journal American Chemical Society, 1904-1930. Miscellaneous Bureau of Chemistry and experiment station bulletins. C. G. Church, 5256 Oakland St., Los Angeles, Calif.

FOR SALE: Abegg-Auerbach Handbuch Anorganischen Chemie, vols. 1-5, bound. Beilstein, Handbuch Organische Chemie, vols. 1-8, original German edition Kruyt, Einfuehrung Physikalische Chemie und Kolloidchemie. Lunge-Berl, Chemisch-technische Untersuchungen, 6 edition, bound. Transactions American Society Chemical Engineers, vols. 3—1940, bound. Venino, Handbuch Praeparativen Chemie., vol. 1, 1913, vol. 2, 1923. Zeitschrift Anorganische Chemie, vols. 40-53, 118-24, 178-235.
Box 92-T-12, Ind. & Eng. Chem., Easton, Pa.

FOR SALE. Immediate delivery, fully guaranteed laboratory equipment, reasonably priced. L & N PH Instruments, Zeiss Sugar Refractometer, B & L Microscopes and others, Dubosq Colorimeters, Braun UA Pulverizer, Mullen Jumbo Paper Tester, Electric Water Baths, Assay Balances, Pulp Balances, Analytical Balances, Leits Projection Microscope, International Centrifuges, Microtomes, Drying Ovens, Incubators, Vertical and Horisontal Autoclaves, Stokes Water Stills, Hoskins Furnaces, Schmidt & Haensch Precision Saccharimeters, Double Wedge for tubes to 400 mm., Large Elconap Incubator, etc. Write us your immediate requirements for laboratory equipment. Quotations are cheerfully furnished. The Laboratory Exchange, 24 E. 21st Street, New York City.

FOR SALE, Pulp Balances, only a few more are available of these standard American unused pulp balances in fine mahogany cases with drawer and sliding counterpoised door, 150 gr capacity, 1 mg sensitivity. Priced at $27.50 for immediate delivery. We suggest that you order promptly, for early delivery. The Laboratory Exchange, 24 E. 21st St., New York City.

Continuous Bleaching Process

PRODUCTION of military textiles is speeded by a new continuous bleaching process which turns cloth white in two hours at rates up to 200 yards per minute, E. I. du Pont de Nemours & Co., Inc., has announced. Processes are operating or being installed in mills in Massachusetts, Rhode Island, Delaware, Virginia, North and South Carolina, and Georgia.

"Kier" or "batch" bleaching, which requires 8 to 24 hours, is replaced by this fast, continuous bleaching with hydrogen peroxide.

This process not only hastens the bleach but allows precise control of all conditions—speed, steam, chemical absorption, and other factors—from start to finish.

Pump Tank Fire Extinguisher

THE American-LaFrance Foamite Corp., Elmira, N. Y., has designed a new pump tank with the amount of critical materials used in its manufacture reduced to a minimum. The tank produces a straight stream and not a spray, in compliance with the latest requirement of the OCD for controlling magnesium-type incendiaries. It is made in 5- and 0.4-gallon sizes.

Instrument and Control Panels

IN STEP with the effort to conserve sheet steel The Hays Corp., Michigan City, Ind., announces instrument and control panels made of Masonite reinforced with steel angles. Masonite material takes a finish comparable to steel.

THE Standard Oil Co. (N. J.) under the terms of a preliminary agreement will acquire all assets of the Santa Rita Oil and Gas Co., Cut Bank, Mont., including two wholly owned subsidiaries, Northwest Refining Co. and the Santa Rita Purchasing and Storage Co.

ABRASIVES
under Government Control in Bohemia-Moravia ... 1106
New, Discovered in Great Britain through Study of Silicosis ... 1245
Abstract Service, on Synthetic Resins, Rubbers, and Plastics. (Publication) ... 293
Academy, National, of Sciences. *See* National Academy of Sciences.
Accelerators and Antioxidants in the Rubber Industry. Paul I. Murrill ... 1361
ACCIDENTS
Accident Facts. (Publication) ... 1262
Accident Rates in the Chemical Industry.
Dangers of Blasting Caps ... 505
Ethylene Oxide Hazard ... 1318
Isopropyl Ether Explosion. B. L. Herrington ... 1458
Safety
Liquid Carbon Dioxide as Fire Extinguisher ... 1688
Program Initiated in Colleges by Alpha Chi Sigma ... 239
Standard Oil Co. of Indiana Record for, Set ... 1059
ACETIC ACID
French Firm to Produce ... 415
Price Control ... 124
U. S. Supplies Netherlands Indies ... 278
ACETIC ANHYDRIDE
Manufacture of. Patented ... 564
WPB Activities ... 1375
ACETONE
By-Product Studied as Protein Food for Animals in Great Britain ... 47
Chile's Imports Supplied by U. S. ... 624
Price Control ... 1186
Acheson Medal. *See* Awards.
Acid Open Hearth Research Association Studies Steel Problems for Furnaces ... 1272
Acid and Paint Companies of Hungary Merged ... 1105
ACIDS
Mexico Produces on Large Scale ... 1106
Nomographs on ... 56
Organic, India's Production Increases ... 182
See also kind.
Acoustic Fences Aid Guards ... 504
Acrylic Acid Esters. *See* Esters.
Acrylonitrile, WPB Activities ... 744
Adams, Roger, Editor. Organic Reactions. Volume 1. (Book Review, Hurd) ... 1326
Adams, William Hussey. (Obituary) ... 1534
Adams, W. W., Wrenn, V. E., and Horton, L. S. Production of Explosives in the United States. (Book Review) ... 877
Adler, Edward, Young Author's Prize to ... 616
Aeronautics, Bureau of, Mellon Institute Does Research for ... 608
AGAR
Duke University Marine Station Does Research on ... 898
New Zealand Increases Output of ... 1106
New Zealand Licenses Manufacture of ... 418
Price Control ... 910
Sodium Cellulose Glycolate Substitute for, in Germany ... 857
WPB Activities ... 283, 860, 1062
Agfa-Ansco Celebrates Centennial. (Photo) 1051
Aguilar-Santillan, Rafael, Death Announced 128
AIRPLANES
Industry Helps to Sponsor Research Group ... 758
Silver, Engine Bearings ... 191
AIR RAID PRECAUTIONS
For Chemical Works. R. Walters ... 1318
Chemists Train Wardens ... 345
ALCOHOL
Butyl
Price Control ... 1186
WPB Activities ... 744
Capryl, WPB Activities ... 796
China Increases Production ... 182
from Corn, U. S. to Import from Argentina ... 334
Distilleries to Be Converted to Production of ... 1180
-Distilling Plants to Be Established in Argentina ... 1374
Entire Production Purchased by Finnish State Monopoly ... 1657
Ethyl
Butadiene from ... 767
Operation by Trenton Valley Distillers Corp ... 1690
Price Control ... 744, 1303
WPB Activities ... 183, 1062, 1375
Wheat to Be Sold for Production of ... 185
Finland Increases Production from Residues of Cellulose Industry ... 1177
India Expects Increased Production ... 1456
Industrial
American Distilling Co. to Assist Government in Producing ... 1519
Distilleries to Be Converted to ... 862
New Plant Operating in Ireland ... 736
Price Quotations Stopped ... 50
WPB Program Advances ... 471
Ireland Produces, from Potatoes ... 736
Isopropyl, WPB Activities ... 796
Methyl
Argentina's Imports Fluctuate ... 532
Charcoal Plant in Finland to Produce ... 966
French Firm to Produce ... 415
Production in Australia ... 795
Production Increases ... 334
WPB Activities ... 49, 123, 541
New Process Dedicated to Public Use ... 1237
Panama's Output in 1941 ... 735
Paraguay Exports Surplus ... 1577
Prices Boosted in Uruguay by Production and Container Costs ... 794
Produced from Oranges ... 1060
Revenue Act Extended to All Distilled Spirits ... 1528
Rubber from, Opposition to, Denied by Standard Oil Co. of Indiana ... 806
Rubbing, WPB Activities ... 1518
Sugar Beets, Source of, in Denmark ... 858
Sulfite
Process Utilizes Waste Liquor in Germany ... 1175
Swedish Production Encouraged ... 47
Syrian Production Decreases ... 1283, 1456
WPB Activities ... 672, 1113, 1625
Wineries of California May Produce ... 1380
Alexander, Jerome. Flash of Genius. (Correspondence) ... 806
Algin, Ireland Uses, in Making Waterproofing Agents ... 1456
Alginic Acid Textile Fibers. C. H. S. Tupholme ... 883
ALIEN PROPERTY CUSTODIAN
Acquires American Potash & Chemical Corp. Stock ... 1545
Announces Seizure of Chemical Equipment Co ... 1138
Appoints President to General Dyestuff Corp ... 912
Controls U. S. Patents ... 1580
E. Leitz, Inc., Taken Over by ... 1268
Offers Foreign Patent Applications ... 1519
President Appoints Leo T. Crowley as ... 376
Requires Reports on Patents ... 862
Schering Corp. Taken Over by ... 607
Seizes Copyright Rights of Beilstein's Handbook ... 1540
Seizes Enemy-Owned Patents ... 862, 1382
Takes Over Companies ... 925
ALKALIES
Mexican Production of, Difficult ... 281
Nomographs on ... 56, 143
Allen, Charles Morse. (Obituary) ... 544
Allied Chemical & Dye Corp. Continues Fellowship ... 540
ALLOCATIONS
Chemical
to Industry Announced ... 1578
for Latin America Announced ... 542, 911
See also kinds of materials.
Alloys, Beryllium, Resistance to Heat and Fatigue Increased ... 1070
ALPHA CHI SIGMA
George Washington Chapter Establishes Award ... 1005
Initiates Safety Program in Colleges ... 239
Meeting Report ... 922
Alsop Award. *See* Awards.
ALUMINUM
Canada Increases Units to Produce ... 1316
Increased Shipments for 1941 ... 1138
Industry
Expanding in Italy ... 733
Frary, Francis C ... 1646
in Japan Enlarged ... 1105
Italian Output Expanding ... 1179
Machining Alcoa. (Publication) ... 1590
New Process for Production of ... 1065
New Processes for, Approved ... 1134
Paint. *See* Paint
Pigment. *See* Pigment.
Plants, WPB Activities ... 672
Production Planned in Yugoslavia ... 1315
Reynolds Metal Co. Interested in Brazilian Production of ... 1520
Spanish Production to Be Increased ... 1315
Training Workers in Welding, Riveting, and Machining. (Movie) ... 1208
U. S. Output Estimated for 1943 ... 742
WPB Activities ... 183, 332, 744
